Except in the bats, the patagium does not form a wing, and the progress of the animal through the air is not a true flight, but only a greatly protracted leap. In bats the membranous expansion is stretched chiefly between the enormously lengthened digits of the hand; in the case of the other mammals named, the patagium is for the most part a fold of the common integument of the body, stretched from the fore to the hind limb. The patagia of the pterodactyls or extinct flying reptiles were wings, constructed upon lengthened digits, much like those of bats. The case is different with the flying-lizards of the present day, in which the patagium is stretched upon extended ribs. See *cut* at *dragon*. Also called *parachute*. (b) The fold of integument which occupies the reentrant angle between the upper arm and the forearm of a bird, bringing the fore border of the wing to a smooth straightish free edge when the wing is closed. (b) The grant by a government to the author of a new and useful invention, or to his assigns, of the exclusive right of exploiting that invention for a specified term of years; also, the instrument or letters by which a grant of land is made by a government to a person or corporation. By the United States Revised Statutes, sec. 488, etc., any person, whether a citizen or an alien, may obtain patent protection for the term of seventeen years "who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned." The fact that the invention has been first patented in a foreign country will not debar the inventor from obtaining a valid patent in the United States, unless the same has been here "introduced into public use for more than two years prior to the application." But the patent will expire with that foreign patent having the shortest term. In the application of the several clauses of this statute, distinctions arise of difficult and delicate character, which are the constant subject of controversy. For the United Kingdom of Great Britain and Ireland and the Isle of Man, patents are granted (under 46 and 47 Vict., c. 57, 1883) to any person, whether British subject or not. The general principles as to what constitutes an invention or improvement are substantially the same as above stated. For each of the principal British colonies there is a separate statute.

**patina** (pat'i-nā), *n.* [*< L.* *patina*, *patena*, a broad shallow dish, a pan: see *patent*, *pan*.] 1. A bowl; a patella.—2. (a) An incrustation which forms on bronze after a certain amount of exposure to the weather, or after burial beneath the ground. It is, when perfectly developed, of a dark-green color, and has nearly the composition of the mineral malachite (hydrated carbonate of copper). Such an incrustation, although very thin, is considered to add greatly to the beauty of an antique object, especially of a bust or statue, and is of importance as protecting it from further oxidation. Artificial and evanescent patinas are produced by forgers of antiquities by the application of heat or of acids, and in various other ways. Some modern bronzes acquire a dark-colored patina, which is a disfigurement rather than an ornament. Elaborate investigation on the part of various chemists has failed to explain this ill-colored patina very satisfactorily. It is believed, however, that coal-smoke in large cities may be a cause of its formation, as under such circumstances it contains particles of carbonaceous matter; and, also, that the present almost universal practice of putting considerable zinc into the bronze, to facilitate its casting, is one of the causes of this defect. The dark color of the patina of Japanese bronze has been shown, in a considerable number of cases at least, to be in all probability due to the presence of lead in the alloy. Also *patine*. (b) By extension, the surface-texture or -color which other works of decorative art, as a wooden cabinet or the like, gain through the action of time. (c) The surface, produced partly by accretion, partly by discoloration and the effects of acid in the soil, given to marble by long inhumation.—3. The public rights of the child, however, remained intact, as that of voting and that of holding a magistracy.

Hence—2. In subsequent Jewish history, one of the heads of the Sanhedrim after the destruction of Jerusalem and the dispersion, the patriarch of the Western Jews residing in Palestine, that of the Eastern in Babylon.—3. In the early church, and in the Orthodox Greek and other Oriental churches, a bishop of the highest rank; in the Roman Catholic Church, a bishop of the highest rank next after the Pope. In the early church the highest dignity, which came in time to be designated as that of *patriarch*, belonged from time immemorial, and as was believed from apostolic days, to the bishops of Rome, Alexandria, and Antioch—these three see ranking as to dignity, precedence, and privileges in the order named. The Council of Constantinople (A. D. 381) gave the bishop of that see prerogatives of rank next after Rome, and the Council of Chalcedon (451) confirmed this, decreeing that this canon conferred an equality of prerogatives with Rome, still leaving the latter see, however, a higher rank. Since that time Constantinople has always stood at the head of the orthodox Oriental sees, and since the sixth century its bishop has borne the title of *ecumenical patriarch*. The patriarchal dignity of Jerusalem was not recognized till the Council of Chalcedon. Constantinople, Alexandria, Antioch, and Jerusalem still remain the four great patriarchates of the orthodox Eastern Church. In 1552 Moscow was made a patriarchate, ranking next after these, but since 1721 the place of patriarch of Moscow has been represented by the Holy Governing Synod. Besides the orthodox Oriental patriarchs, there are others, representing the Armenian, Jacobite, Coptic, and other Oriental churches, and also Latin or Roman Catholic titular patriarchs of the same sees. In the Roman Catholic Church the Pope is regarded as having in his papal capacity a rank superior to his rank as patriarch, and the cardinals also take precedence of patriarchs. There are also three minor patriarchs in the Roman Catholic Church—the of the Indies, of Lisbon, and of Venice. The title of *patriarch* seems to have first come into use in the Christian church in imitation of a similar title given to the head of a Jewish *patria*, or group of communities. In general usage it was apparently first given, without definite limitation, to senior bishops or bishops of special eminence. The bishops of the great patriarchal sees were at first called *archbishops* (in the older sense of that title). From the fourth century the title of *patriarch* came to be

commonly applied to the bishops of the patriarchal sees, and is so used in imperial laws of the sixth century. It was not, however, till the ninth century that it became strictly limited to these. Exarchs, metropolitans, and archbishops rank next after patriarchs. See *catholicos*.

The Primate of all England was also *Patriarch* of all the British islands. *E. A. Freeman, Norman Conquest*, V. 158.

In correctness of speech, we are assured by Theodore Balsamon, the *Patriarch* of Antioch is the only Prelate who has a claim to that title—the proper appellation of the Bishops of Rome and Alexandria being Pope; of Constantinople and Jerusalem, Archbishop.

Shak., *Rich. III.*, i. 2. 54.

**7.** A design or figure corresponding in outline to an object that is to be fabricated, and serving as a guide for determining its exact shape and dimensions; in *molding*, the counterpart of a casting in wood or metal, from which the mold in the sand is made. — **8.** In *numis.*, a specimen struck in metal by the mint as a model or sample for a proposed coin, but not ultimately adopted for the currency. Thus, the Gothic crown of Queen Victoria, struck as a model for a crown piece, but never adopted for currency, is a *pattern*.

A *proof*, on the other hand, is an early impression struck

from dies used for the production of coins actually current. See *proof*.

9. A decorative design intended to be carried out in any manufacture; hence, such a design when executed: as, a sprig *pattern*; a heraldic *pattern*; silk or damask of a beautiful *pattern*.

Many manufacturers of ornamental goods have inventors in their employment, who receive wages or salaries for designing *patterns*, exactly as others do for copying them.

J. S. Malt.

Every individual stone in the tower has a *pattern* carved upon it, not so as to break its outline, but sufficient to relieve any idea of monotony.

J. Fergusson, Hist. Indian Arch., p. 421.

10. In *gun-making*, the distribution of shot in a target at which a shot-gun is fired. In a circle called the "killing circle" by sportsmen and gun-makers (which at a range of 40 yards is from 26 to 30 inches in diameter), the shot should be evenly distributed, so that there can be no possibility of escape for game within the periphery of this circle. The more uniform the distribution of the shot the better is the pattern. The number of shot in the pattern varies widely, according to the size of the shot, which is selected in accordance with the kind of game sought. To secure the desired pattern it is sometimes necessary to re-bore the barrel of a gun several times.—*Dambrod, frill, hawthorn, onion, pomegranate, etc., pattern.* See the qualifying words.

**Declared pattern**, the number of pellets of a given size, which, with a given weight of the shot and a given weight of a specified kind of powder, a shot-gun is stated by the maker to be able to deliver and distribute in a "killing circle" of a stated diameter at a prescribed range, and with a good degree of uniformity in the distribution. See def. 10.—*Syn. 1. Model, Ideal, etc.* See *example*.

**pattern** (pat'érn), *v. t.* [*< pattern, n.*] 1. To imitate in imitation of some pattern or model; copy.

Let any reasonable man judge whether that Kings Reign be a fit time from whence to *pattern* out the Constitution of a Church Discipline.

Milton, Reformation in Eng., i.

2. To serve as a pattern, example, or precedent for.

For men, by their example, *pattern* out Their imitations.

B. Jonson, Cynthia's Revels, v. 3.

His example will live in the memory of those who knew him as one to be *patterned* after. *Sci. Amer.*, N. S., LX. 49.

3. To cover with a design or pattern.—4*t.* To match; parallel.

The likeness of our mishaps makes me presume to *pattern* myself unto him.

**pattern-box** (pat'érn-boks), *n.* In *wearing*: (a) A box at each side of a loom in which are placed a number of shuttles any of which may be thrown along the shed by an automatic device, according to the pattern of the fabric. See *pattern-chain* and *pattern-cylinder*. Also called *shuttle-box*. (b) The box perforated to accord with the harness-cards of a Jacquard loom. Also called *prism* or *cylinder*.

**pattern-card** (pat'érn-kârd), *n.* 1. (a) A piece of cardboard to which a sample or specimen of cloth, velvet, or the like is attached. Hence—(b) A number of such pieces of cardboard, forming a sort of book, or folding alternately so as to open out in a long strip and exhibit, at one time, a number of patterns of stuff.—2. In *wearing*, one of the perforated pieces of cardboard used in the Jacquard attachment to a loom. The cards are joined together in a flexible endless chain, and pass over the pattern-box, each in turn controlling the harness system. Whenever a hole in a card and one in the box coincide, the corresponding rod connected with a warp-thread enters the hole and its warp-thread is raised. See *loom*.

**pattern-chain** (pat'érn-chân), *n.* In *wearing*, a device for automatically bringing the shuttles to the picker, according to the sequence required by the pattern. In one form, in the shuttle-boxes at the ends of the race, the links of the chain

vary in height, so as to raise the rod connected with the shuttle boxes more or less, thus bringing one shuttle or another into position to be struck by the picker.

**pattern-cylinder** (pat'érn-sil-in-dér), *n.* In *wearing*, a cylinder, or in some forms of loom a wheel, with projections so arranged on its periphery that its movement shall control the harness-system and the pattern-boxes, and thus fix the pattern of the woven fabric. Also called *pattern-wheel*.

**pattern-drawer** (pat'érn-drâ'ér), *n.* One who designs or prepares patterns for any kind of ornamental manufacture.

**pattern-maker** (pat'érn-mâ'kér), *n.* In *mech. engin.*, a workman who makes the patterns used by molders in foundry-work. These patterns are usually made, in the first instance, of pine or mahogany, the pattern-maker working from drawings. If the patterns are to be much used, they are frequently duplicated in metal, the pattern after casting being filed and scoured smooth, then warmed, and coated with wax. Metal patterns have the advantage of not warping like wood patterns. Patterns are also sometimes made of plaster of Paris swept by trowels while in a plastic state. This method has been successfully applied in architectural work in the production of cornices and analogous forms. Pattern-making is a distinct trade, requiring great skill in wood-working, combining as it does the finest joinery-work with the art of wood-carving and the ability to read and interpret the most complicated mechanical drawings.

**pattern-molder** (pat'érn-môl'dér), *n.* One who makes molds for iron castings. *Simmonds*.

Specifically, the elaborate defense introduced about 1400, consisting of splints, sliding one over the other, or of a single piece so formed and secured by pivots that, as the arm was raised, it moved toward the neck, falling again by its own weight as the arm was lowered. The pauldron of the right shoulder was usually smaller than that of the left, to allow of free movement of the sword-arm, and especially for passing the lance under the armpit when couched. The pauldron of the close of the fifteenth century forms an inseparable part of the articulated and elaborated suit of plate armor. See *paulet*.

There is but one species, *P. imperialis*, native of Japan, a large tree, resembling the catalpa in appearance, bearing broadly heart-shaped opposite soft-hairy leaves, and large terminal panicles of showy pale-violet or blue and brown-spotted flowers in early spring. The many large and conspicuous pointed capsules are persistent one or two winters, containing loose in each of their two cells an almond-like thick-

**Application of payments, appropriation of payments**, the determining which of several obligations shall be extinguished or reduced, when a payment not sufficient to extinguish all is made. Thus, if a debtor owing to the same creditor an open account, a bond, and a note secured by mortgage on the debtor's property pays a sum sufficient to satisfy only one, it is for his interest that it be applied to the mortgage so as to free his property from incumbrance; and it is for his creditor's interest that it be applied to the open account, which is unsecured, and will be outlawed before the bond. In the first year the disease usually causes only a more or less premature ripening of the fruit; in the second year it is more marked, the whole tree having a sickly languishing appearance, with the entire foliage dwarfed and rolled or curled up, and yellowish or brownish-red (whence the name) in color. The diseased tree rarely dies in the second year of attack, and rarely lives beyond the fourth or fifth year. Little or no valuable fruit is produced after the second year. The common peafowl, *P. cristatus*, is a native of India, said to have been introduced into Europe by Alexander the Great, and now every where domesticated. The male, female, and young are respectively called *peacock*, *peahen*, and *pea-chick*. The peacock is one of the

Peacock *Pavo cristatus*

largest of the gallinaceous birds, and in full dress is the most magnificent of all birds. The gorgeous train which constitutes its chief ornament is often four feet long, and consists of an extraordinary mass of upper tail-coverts, not true tail-feathers, which latter the train overles and far outreaches. These tail-coverts are elegantly formed of spray-like decomposed webs enlarged and recomposed at the end, and marked with glittering ocelli or "eyes." This whole mass of plumage is capable of being erected

and spread in a vertical disk completing a semicircle, or more, of the most brilliant iridescent colors, chiefly green and gold. The tail feathers proper and the primaries are chestnut; the neck and breast are blue of a peculiarly rich tint called *peacock-blue*. The head is crested with a bunch of about twenty four upright plumes. The length proper is about four feet, the train, when fully developed, measuring from two to four feet more. The peahen is much smaller and more plainly feathered, without the train. The peacock was sacred, among the Greeks and Romans, to Hera or Juno, but is now commonly regarded as the symbol of vainglory and as a bird of ill omen. The flesh is edible, like that of other gallinaceous birds. The cry is extremely loud and harsh. See *Pavo, japonicus*; also *cut* under *ocellate*.

*Peak* is of two sorts, or rather of two colors, for both are made of one shell, though of different parts; one is a dark purple cylinder, and the other a white; they are both made in size and figure alike, and commonly much resembling the English bugles, but not so transparent nor so brittle. *Beverley, Virginia, iii. ¶ 46.*

2. The tree *Pyrus communis*. The wild tree is common over temperate Europe and Asia, often scrubby, but under favorable conditions becoming, as under culture, a handsome tree of good height, inclining to a pyramidal form. Though close to the apple botanically, it differs in its more upright habit, smooth shining leaves, pure white flowers with purple stamens, the granula texture of the wild fruit, the juicy melting quality of the fine varieties, and the form of the pome, which tapers toward the base and has no depression around the stem. The tree is long-lived, specimens existing which are two or three hundred years old. The pear was known in a number of varieties in the days of Pliny, but its excellence is of much later date. In recent times it has received great attention, its culture being pushed with special zeal in France. It is a highly successful fruit in the United States. The varieties of pear are numbered by thousands, but only a few are really important. The Seckel is an American variety—the fruit small, but unsurpassed in quality. The Bartlett, known in Europe, where it originated, as *William's bon Chretien*, is also universally popular. Pomologists place some others, as the *beurre d'Angou*, as high as these or higher. Dwarf pears (that is, those grafted or budded on quince-stocks) are more convenient for gardens; standard pears (that is, those grafted or budded on seedling-pear stocks) are commonly more profitable. In some regions, as England and northern France, a liquor is made from the juice of the fruit. (See *percy*.) Pear-wood has a compact fine grain, and is highly prized for cabinet- and mill-work, etc., and second only to boxwood for wood-en-graving and turnery.

Sp. *perilla*, a little pear, a pear-shaped ornament, OHG. *perula*, a little button or tassel (Florio). Cf. *pearl*.] 1. A nacreous concretion, or separate mass of naure, of hard, smooth, lustrous texture, and a rounded, oval, pear-shaped, or irregular figure, secreted within the shells of various bivalve mollusks as a result of the irritation caused by the presence of some foreign body, as a grain of sand, within the mantle-lobes. The formation of a pearl is an abnormal or morbid process, comparable to that by which any foreign body, as a bullet, may become encysted in animal tissues and so cease to cause further irritation. In the case of the mollusks which yield pearls, the deposition is of the same substance as the naure which lines the shell, hence called *mother-of-pearl*, in successive layers upon the offending particle. Fine pearls have frequently been found in working the mother-of-pearl shell. Chemically, pearls consist of calcium carbonate interstratified with animal substance, and are hence easily dissolved by acids or destroyed by heat. The chief sources of the supply of pearls are the pearl-oysters and pearl-mussels, *Ariculida* and *Unionida*, and foremost among the former is the pearl-oyster of Indian seas, *Margarita margaritifera*. Pearls are generally of a satiny, silvery, or bluish-white color, but also pink, copper-colored, purple, yellow, gray, smoky-brown, and black. The finest white pearls are from Ceylon, the Persian Gulf, Thursday Island, and the western coast of Australia. The yellow are from Panama. The finest black and gray pearls are obtained in the Gulf of California, along the entire coast from Lower California to the lower part of Mexico. There are two distinct varieties of pink pearl: those from the common conch-shell, *Strombus gigas*, of the West Indies, and those from the unios or fresh mussels found in Scotland, Germany, France, and the United States (the finest being obtained principally from Ohio, Tennessee, Kentucky, Texas, and Wisconsin), also from the small marine shell *Trigona pectinensis* of Australia. Purple, light-blue, and black pearls are found in the common clam, *Venus mercenaria*. The yellow color of Oriental pearls generally results from the decomposition of the mollusks in which they are found. The value of a pearl depends entirely on its perfection of form (which must be either round, pear-shaped, or a perfect oval), on its luster or "orient," and on the purity of its color, a tint of yellow or gray detracting very much from the value. Pearls are sold by the pearl-grain, four grains equaling one carat. (See *carat*, n., 4.) From 1880 to 1890 the demand for pearls and the rarity of their occurrence resulted in an advance in price of from 250 to 300 per cent., the larger pearls having advanced more, proportionally, than the smaller ones. Until about 1860, pearls were generally valued as multiples of a grain. The value of a pearl larger than one grain was estimated by squaring its weight and multiplying this by the value of a one-grain pearl; thus, a two-grain and a five-grain pearl were worth respectively 4 and 25 times the value of a one-grain pearl.

Eng.]—11. *Echols*, a name sometimes given to a particle of the consecrated wafer: still current in the Oriental Church.—12. A name given by gilders and manufacturers of jewelry to granules of metal produced by melting it to extreme fluidity, and then pouring it into cold water. The stream in pouring should be so small, and the crucible held at such a distance from the water, that the metal will break up into fine drops (pearls) before reaching the water, which instantly cools them. The cooled granules are usually pear-shaped. The epithet *granulated* is more commonly applied in the United States to metals prepared in this way, as granulated copper, silver, zinc, etc., used in the preparation of jewelers' alloys on account of their convenience in weighing, and for other purposes—pure granulated zinc being much employed by chemists for generating pure hydrogen gas, as in Marsh's test for arsenic, etc.

Also called *bird's-nest bodies* and *epidermic spheres*.—Half pearls, pieces cut from pearls that are very irregular and have only one lustrous side or corner, which is slit off. They are extensively used in jewelry, and are much less expensive than whole pearls, but are very liable to become discolored if wet, as the layers of the pearl, being cut across, absorb the water, and any impurities it may contain show through the layers.—Imitation, artificial, or false pearls are of two kinds, *solid* or *massive pearls* and *blown pearls*. (See *Lemaire pearl* and *Roman pearl*.) The first are known as *Venetian pearls*, and are manufactured chiefly on the island of Murano, near Venice. They are made from small white or colored glass tubes, the desired hues being produced by the use of oxid of tin and other metals. Blown pearls consist of small globules of thin glass, coated on the inside with the so-called oriental pearl essence, or essence d'orient. Their manufacture is attributed to Janin or Jaquin, who lived in Paris about 1680, and who was the first to line hollow glass balls with this mixture, which he prepared with the scales of a small fish, the bleak, common in France and Germany, and mullage. The mixture was first suggested by his observing the pearly luster of the scales that were detached from the fish when they rubbed against one another in a trough. The scales of 15,000 fish are required to make one pound of oriental-pearl essence.—Inner pearl, in *lace-making*, ornamental loops worked around the edge of an imitation in lace, as distinguished from *perl*, which is a loop on the outer edge.—Large pearl, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, these may be separated to the greatest extent without breaking the connecting thread of syrup. In this condition the sugar forms a large drop, or "pearl," if suspended from a rod.—Lemaire pearl, an imitation pearl composed of a solid glass ball externally coated with a varnish composed of oriental pearl essence, white wax, alabaster, and parchment glue. A. Castaldi, Gems.—Little pearl, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, the finger and thumb may be separated to nearly the full extent without breaking the thread of syrup. Large quantities are used in the East for medicinal purposes, in the composition of electuaries supposed to possess stimulating and restorative qualities.—Small pearl. Same as *little pearl*.—Smoked pearl, mother-of-pearl having black or very dark veins or cloudings.—Virgin pearls, unpierced pearls of fine quality.

A peasant may or may not be the proprietor of the land which he cultivates; in Great Britain he is distinguished from a *farmer* as having less property, education, or culture, or inferior social position; but the word is very vague. The word is not used in the United States, where there is no comparatively stable body of agricultural laborers corresponding to the European peasant.

*peat*. Cf. *beat*3, *sod*, *< bet*2, *c.*, *mend* (a fire, etc.). Cf. *purse*, var. of *burse*.] 1. Partly decomposed vegetable matter, produced under various conditions of climate and topography, and of considerable importance in certain regions as fuel. Peat occurs in many countries and in different latitudes, but always either in swampy localities or in damp and foggy regions. It is formed of vegetable matter undergoing decay, and in some respects it is the modern representative of the coal of the earlier geological epochs, and its formation illustrates the conditions under which coal has originated. Peat is abundant in northern Europe, and particularly so in Ireland, where it is perhaps of greater importance as fuel than in any other country. It occurs in India, especially in the Neilgherry hills and in Bengal; also in various parts of the United States, and there are in the latter country regions (especially in New England) where it is occasionally used as fuel. The vegetation of which peat is made up in the various countries where it occurs is quite different, and occasionally the number of species which have taken part in its formation is large. The genus *Sphagnum* is an important element in much of the European peat. The peat of Bengal, on the other hand, is said to be formed almost exclusively from one plant, the wild rice, *Oryza sylvestris*. The peat of New England is made up of a considerable variety of aquatic plants. Peat is very spongy, and contains a large amount of water near the surface; the deeper down it is taken, the more compact it is. A great variety of processes for compressing and hot-drying it have been invented and put in use in different parts of the world.

2. A small block of peat-bog or -moss, resembling an ordinary brick in shape, cut and dried for fuel.

*Woodward, Geol. of England and Wales (2d ed.), p. 525.*

**peat-bog** (*pet'bog*), *n.* The common name in the United States for those accumulations of peat which are known by this name in Great Britain, but also, and more generally (except in Ireland), as *peat-mosses* and *peat-moors*.

**peat-charcoal** (*pet'chär'köl*), *n.* Charcoal made by carbonizing peat. This is done in various ways, as in piles, open kilns, pits, and ovens. Peat-charcoal has been much experimented with, and used in metallurgical operations to some extent for fully three hundred years. The carbonization of ordinary air-dried peat produces a very friable charcoal, and the denser the peat is made, by compression or in other ways, the better the article produced.

In France *peat-charcoal*, under the name of *Charbon roux*, is much used for making gunpowder. *Ure, Diet., III. 527.*

**peat-coal** (*pet'köl*), *n.* A soft lignite, of earthy character.

**peat-machine** (*pet'ma-shēn'*), *n.* A machine, similar in principle to the brick-machine, for preparing peat for fuel, either without addition

or by admixture of other substances, as coal-dust, tar, etc. These machines are, in general, grinders and pressers, which pulp the material in order to render it homogeneous, and then compress it into blocks of convenient form.

**peat-moor** (*pet'mör*), *n.* Same as *peat-moss*. In the United States such deposits are called *swamps* or *bogs*. See *peat*l and *peat-moss*.

Peat is very largely dug in the moorlands of Somersetshire, near Edington and Shapwick, between Glastonbury and Highbridge. Some of these beds have been worked for fuel from the time of the Romans, and probably earlier, while others are of more recent formation. The *peat moors* or "turbary lands" have an irregular distribution; and the peat, which in places is 14 or 15 feet thick, is due largely to the growth of the common sedge (*Carex*), whence Sedgemoor derives its name.

*Woodward, Geol. of England and Wales (2d ed.), p. 526.*

**peat-moss** (*pet'mós*), *n.* 1. Moss entering into the composition of or producing peat; moss of the genus *Sphagnum*.—2. A peat-bog or -swamp; a name frequently given in Great Britain to those accumulations of peaty matter which in the United States are commonly known as *peat-bogs*.

*Peat mosses* cover many thousand square miles of Europe and North America. About one seventh of Ireland is covered with bogs, that of Allen alone comprising 235,500 acres, with an average depth of 25 feet.

S.] (b) *Ficia Americana*, a common species throughout the United States, with from four to eight pairs of leaflets, and purplish flowers a few in a cluster.

**pea-weevil** (*pe'wē'vī*), *n.* A kind of curculio, *Bruchus pisi*, which infests peas. It is an indigenous North American insect, which probably fed on some other legume before the cultivated pea was introduced; it has spread to Europe, and is now found in Great Britain and along the Mediterranean.

The egg is laid on the outside of the pod, and the newly hatched larva burrows into the nearest pea, in which it feeds and grows to full size. Before transforming to the pupa it provides for its exit by cutting a round hole through all but the outer membrane of the pea. The beetle does not issue until the following spring. See *Bruchus*. Also called *pea-beetle*, *pea-bug*, and *pea-chaffer*.

**peaze**, *n.* An obsolete form of *poise*. *Spenser.*

A small rounded stone. The term is usually applied to stones worn and rounded by the action of water. Pebbles are less in size than cobbles; and ordinary gravels are chiefly made up of sand, the grains of which pass by imperceptible gradations of size into pebbles, with which are frequently intermixed more or less of rounded fragments large enough to be called cobbles.

**pebbling** (peb'ling), *n.* [Verbal *n.* of *pebble, v.*] In *leather-making*, a special kind of grain-ing, in which an artificially roughened or indented surface on the grain side of leather is produced by working upon that side with a roller having a pattern which is the reverse of the pattern to be impressed on the leather. The term is properly restricted to the act of producing an irregular pattern, such as would be produced by pressing irregularly distributed minute pebbles upon the leather; whence the name. A pattern consisting of straight or approximately straight lines is called a *straight grained pattern*, and the leather would be called *straight-grained*; the term *graining* includes pebbling, which is but a special kind of graining, of which glassing or glazing is still another variety.

**pebbling-machine** (peb'ling-mā-shēn'), *n.* In *leather-making*, a machine resembling a polishing-machine in its construction, used to perform the special work called pebbling. The pebbling is done by a roller having on its surface the pattern, in reverse, which it is desired to impart to the grain of the leather. The roller is pivoted to elastic bearings at the lower end of a swinging arm, and is antagonized by a table curved to correspond to the arc through which the rollers act. The leather is supported by the table while subjected to the action of the roller. The imparting of a pattern in imitation of more costly leather is strictly a variety of graining, though often called *pebbling*. Since the machine used for glassing, glazing, or polishing is transformed into a pebbling machine by a change in the roller only, the machine is variously and indifferently called *polishing*, *glassing*, *graining*, or *pebbling-machine*.

**pebbly** (peb'li), *a.* [*< pebble + -y*.] Full of pebbles; abounding with small roundish stones.

Inside, the body is filled with minute ovoid corpuscles (*Microsporidize*), upon the presence and multiplication of which the disease depends. Pebrine is both contagious and infectious. The Pasteur system of selection consists in the microscopic examination of the moth after egg laying, and the rejection of eggs laid by those found to be diseased. The microbe which causes pebrine was named by Lebert *Paustisophyton*, and classed among the pterospores.

**pebrinous** (peb'rī-mis), *a.* [*< pebrine + -ous*.] Affected with pebrine.

Schimper has grouped the *Pecopteridæ*, with regard to their relation to living ferns and with reference to the character of the fructification, in five subdivisions; but "one has only to look at the classification of a few species grouped from the apparent character of the fructifications to see how unreliable are the diagnoses derived from them" (Lesquereux). The grouping of the *Pecopteridæ* suggested by the fossil botanist of the Pennsylvania Geological Survey is as follows: (1) Including the species referred by Schimper to the genus *Goniatopteris*, distinguished by an upward curve of the lateral veins; (2) *Pecopteris* proper, or eucalyptoid, to which division belong the species answering exactly to Brongniart's definition of the genus *Pecopteris*; (3) *Pecopteris* with hairy or villous surfaces, a permanent and easily discernible character; (4) *Pecopteris* with pinnae not distinctly divided into obtuse entire lobes or pinnules, but generally cut on the borders in sharp irregular teeth; and (5) a group containing those species referred to *Pecopteris* which "do not find a place in the former divisions." Kidston (1886) divides the *Pecopteridæ* into two subdivisions, *Pecopteris* and *Dactylothea*;

the genus *Pecopteris* as limited by him includes species previously referred by fossil botanists to twenty-four different genera.

**Pecopteris** (pē-kop'te-ris), *n.* [NL., *< Gr.* *πι- κτωρ*, comb, + *πτερις*, a fern.] A genus of widely disseminated fossil ferns, occurring in large numbers in the coal-measures of Europe and America, and found also in the Middle Devonian of New Brunswick. About 30 species referred to this genus were described by Lesquereux, in 1880, as occurring in the coal-measures of the United States, chiefly in Pennsylvania and Illinois. As described by Brongniart, the genus *Pecopteris* has bipinnate or tripinnate fronds; the pinnae are long and pinnatifid; the pinnules adhere to the rachis by the whole base, and are often more or less deeply comate and not decurrent, and the borders are generally contiguous or nearly so; the secondary veins, which are derived from the median nerve of the pinnules, are simple, bifurcate, or trifurcate. **pedagog** (ped'a-gō-jī), *n.* [Formerly also *pedagogus*; = *F. pédagogique* = *Sp. pedagógico* = *Pg. It. pedagogo*, < *Gr. παιδαγωγος*, the training or guiding of boys, education, < *παιδαγωγος*, a pedagogic: see *pedagogue*.] 1. The art of the pedagogic; the science of teaching; pedagogies.

The tendency to apply the exact methods of science to problems of education is one of the most hopeful signs of present *pedagogy*.

*Science, VI. 341.*

2. Instruction; discipline.

**pedal** (ped'al or pĕ'dāl), *a.* and *n.* [= *F. pédale*, *n.*, = *It. pedale*, < *L. pedalis*, pertaining to the foot, < *pes* (*ped*-) = *E. foot*: see *foot*.] 1. *a.* 1. Pertaining to or connected with a foot or the feet: as, *pedal* extremities.—2. Technically—

(*a*) Of or pertaining to a foot-like part of the body, as of a mollusk: *pedal*: as, a *pedal* ganglion. (*b*) Of or pertaining to the pes or hind foot only: opposed to *manus*.—3. Pertaining to the feet of perpendiculars let fall from one point upon tangents to a fixed locus called a *basis*.—4 (ped'al). In *music*, relating to a pedal.—**Pedal action**, the entire mechanism of pedals in either a pianoforte, organ, or harp, including the pedals themselves, the connecting apparatus of rods, trackers, levers, etc., and their attachment to dampers, sliders, etc.—**Pedal adductor**, the posterior adductor muscle of bivalve mollusks, the anterior one being distinguished as *pedial*. It is the only one in the *Monomyaria*, as oysters and scallops.—**Pedal aponeurosis**, the dorsal fascia of the foot.—**Pedal artery**, the dorsal artery of the foot.—**Pedal bass**. See *organ-pedal*.—**Pedal board**. Same as *pedal keyboard*.—**Pedal check**, in *organ-building*, a device for preventing damage to a pedal keyboard when not in use. It consists of a bar which prevents the pedal keys from being depressed until it is moved. It is usually controlled by a stop knob.—**Pedal coupler**, in *organ-building*, a coupler which connects one of the manual keyboards with the pedal keyboard, so that the latter affects the former.

Usually each of the keyboards may be thus coupled to the pedals. **Pedal curve** or **surface**, the locus of the feet of the perpendiculars let fall from one point upon the tangents to another locus to which the former is *pedal*.—**Pedal ganglia**, infra-esophageal ganglia in the nervous system of *Mollusca*. See *cut* under *Limnæobranchiata*.—**Pedal harmony**, in *music*, same as *organ-pedal*.—**Pedal harp**. See *harp*, 1.—**Pedal key**, in *organ-building*. See *key*.—**Pedal keyboard**, in *organ-building*, the keyboard or set of levers intended to be played by the feet. It consists of black and white keys like the manual keyboards, only on a larger scale. Its used compass in modern organs is from the second C below middle C to the D or the F next above it. It is sometimes *coupler*, the extreme right and left levers being higher than those in the middle, or *radiating*, the front ends of the levers being nearer together than the back ends. Both arrangements being intended to help the player to reach all the keys with equal ease. The pedal keyboard properly sounds the stops of the pedal organ; but it may also be coupled with either of the manual keyboards, and thus may simply extend the resources of the latter. Pedal keyboards are sometimes added to reed-organs, and even to pianofortes. See *pedalier*, and *cut* under *organ*.—**Pedal line**, a line through the feet of the three perpendiculars to the three sides of a triangle, let fall from any point on the circumference of the circumscribed circle. **Pedal muscle**, (*a*) In *human anal.*, same as *extensor brevis digitorum pedis* (which see, under *pes*). (*b*) In *conchs*: (1) Any muscle of the foot or podium of a univalve. (2) The posterior adductor of a bivalve, when there are two. See *cut* under *Astartidae* and *Tridacnidae*. **Pedal note**, either a note or a tone produced by a pedal key, or the same as *organ-pedal*.—**Pedal organ**, in *organ-building*, that one of the partial organs which is played from a pedal keyboard. Its compass is usually about two or two and a half octaves. Its stops are the deepest and most sonorous in the instrument, usually of 16 or 32 feet tone.—**Pedal origin**, the fixed point from which the perpendiculars are let fall. **Pedal passage**, in *organ music*, a passage or phrase intended to be performed on the pedal keyboard. **Pedal piano**, a pianoforte with a pedal keyboard or *pedalier*. **Pedal pipe**, in *organ-building*, one of the pipes belonging to the pedal organ. **Pedal ratio**. See *foot*, 11.—**Pedal rod**, in *harp-making*, a rod connecting a pedal with the mechanism for shortening the strings.—**Pedal soundboard**, in *organ-building*, the soundboard of the pedal organ.—**Pedal stop**, in *organ-building*, a stop or stop-knob belonging to the pedal organ.—**Pedal vesicle**, one of the many little vesicles of the water-vascular system of an echinoderm which are connected with the water-foot or tube-foot, and cause the latter to protrude when full of water. See *cut* at *Echinoiden*.

**II. n.** (ped'al). 1. Any part of a machine or apparatus which is intended to receive and transmit power from the foot of the operator; a treadle; as, the *pedals* of a bicycle.—2. In musical instruments, a foot-lever; a metal or wooden key or projecting bar operated by the foot. (*a*) In the pianoforte two or three pedals are in use: one to lift the dampers from the strings (the *dampers*, *pedal* or *loud pedal*); one to introduce a muffle between the hammers and the strings, or to lessen the distance from which the hammers strike, or to move them so that they shall strike only one string instead of the usual two or three (the *soft pedal*); and sometimes one to hold up the dampers that happen to be lifted when the pedal is pressed down (the *sustaining pedal*). The use of the damper-pedal is indicated by *ped.* at the beginning of the passage where it is needed, and by a ' at its end. The use of the soft pedal is usually indicated by some such expression as *una corda*, 'one string'. The use of the sustaining pedal is usually left to the player's discretion. (*b*) In the pipe-organ several different kinds of pedals are used: those which form the pedal keyboard, and which are like the keys or digitalis for the hands, but much larger (see *pedal keyboard*), and *cut* under *organ*); those which control the drawing of one or more of the stops (*combination pedals*, *composition pedals*, *crescendo pedal*, *diminuendo pedal*, *sfzando pedal*, etc.), that which controls the opening of the flaps or shutters of the swell-box (the *swell pedal*), etc. See the phrases below. (*c*) In the reed-organ and harmonium, one of the treadles by which the player operates the feeders of the bellows. See *reed-organ*. (*d*) In the harp, one of the foot-levers whereby all or some of the strings may be temporarily shortened, and their pitch raised. In modern harps seven pedals are used, any one of which may be used in two ways, raising the pitch either one or two half steps; every pedal affects only the strings of a particular letter-name. By combining the pedals in various ways the instrument may be set in any desired key (tonality). See *cut* under *harp*. (*e*) Collectively, same as either *pedal keyboard* or *pedal organ*.—3. Same as *organ-pedal*.—4. A pedal curve or surface, or one of which another is the *pedal* curve or surface.—**Balanced pedal**. See *swell-pedal*.—**Combination pedal**, in *organ-building*, a metal pedal which enables the player to control the use of several stops at once by his feet. Such pedals are played above the *pedal* keyboard. They are either *singles* or *double-acting*, the former serving either to draw or to retire certain stops, the result depending upon the registration at the moment when the pedal is used, and the latter serving both to draw and to retire certain stops so that the result is always the same whenever the pedal is used. Combination pedals are applied to the stops of all the keyboards usually beginning with those of the great organ. They include a *forte pedal* (single-acting) which draws all the stops of the keyboard to which it belongs; a *mezzo pedal* (usually double-acting) which draws most of the important *sfz* and *f* stops of its keyboard; and a *piano pedal* (single-acting) which retires all but one or two of the lighter stops. Combination pedals do not always affect the stop-knobs; if not, they are so made as to be hooked down when in use, and when they are released the combination made by the stop-knobs remains unchanged. Combination pedals of all the above varieties often control also certain of the stops of the pedal organ, so that, when a given combination on the manuals is used,

appropriate pedal stops are also drawn.—**Composition pedal.** Same as *combination pedal*. **Coupler-pedal**, in *organ-building*, a pedal which controls one of the couplers, usually that which unites the great and pedal organs.—**Crescendo pedal.** See *crescendo*.—**Diminuendo pedal.** See *diminuendo*.—**Double-acting pedal.** See *combination pedal*. **Extension-pedal.** Same as either *dampers-pedal* or *sustaining pedal*. See def. 2 (a). **First negative pedal**, the looms to which the basis locus is the pedal.—**First pedal**, the pedal curve or surface. **Forte pedal.** See *combination pedal*.—**Harp pedal.** Same as *soft pedal*.—**Inner pedal.** See *inner*. **Loud pedal.** See def. 2 (a). **Mezzo pedal.** See *combination pedal*.—**Oblique pedal**, a plane curve the locus of intersections under a constant angle of lines through a fixed point with tangents to a fixed curve.—**Open pedal.** Same as *loud pedal*.—**Piano pedal.** See *combination pedal*. **Ratchet-pedal.** See *swell pedal*.—**Rat-trap pedal**, a kind of foot-piece used on some bicycles and velocipedes consisting of a flat iron or steel bar bent into oblong rectangular form, and having its meeting ends welded together. The pedal-pivot passes midwise from end to end of the pedal, through holes made in the ends; and the upper edges of the longer parallel sides are serrated. The whole thus much resembles a small steel trap with open jaws, as when set for catching rats, etc., whence the name.—**Reversible pedal.** See *coupler-pedal*. **Second pedal**, the pedal of the pedal.—**Sforzando pedal**, in *organ-building*, a pedal which suddenly and temporarily brings the entire power of the instrument into use, so that a forcible accent can be produced.—**Single-acting pedal.** See *combination pedal*.—**Soft pedal.** See def. 2 (a).—**Sustaining pedal.** See def. 2 (a).—**Swell-pedal**, in *organ-building*, a pedal which opens the shutters or blinds of the swell box, and so increases the power of the tones produced by the pipes in it.—**Toe-and-heel pedal.** Same as *balanced pedal*.

It includes about 46 species, belonging to 12 genera and 4 tribes, natives of warmer regions everywhere, especially of Africa. *Martynia*, *Sesamum*, and *Pedalinum* (the type) are the best-known. The only species, *P. murex*, is a native of India and tropical Africa. It is a smooth annual herb, with musky odor, somewhat branching, with opposite or alternate broad and coarsely toothed leaves, and yellow flowers solitary in the axils. The fresh branches stirred in water or milk render it temporarily mucilaginous without changing the taste, odor, or color. They are used in markets of India in the preparation of adulterated butter-milk, and the mucilaginous seeds are used in native poisons.

There are over 135 species, mostly montane, alpine, or arctic, natives of Europe, North America, and northern and central Asia, and (a very few) of the mountains of south America and India. They are perennial herbs, with the leaves pinnately or irregularly cut, developed chiefly at the base of the stem and becoming bract-like above. The flowers form a terminal spike, usually yellow or reddish, often one-sided, and followed by compressed projecting curved and beaked capsules. *P. Some species are cultivated, chiefly from seed, and are known collectively as *lousewort*, a name derived from the common British heath- and swamp-louseworts or red-rattles, long imagined to breed lice in sheep that feed on them—an idea apparently founded merely on their presence in poor soil.

What *pedigree* are you?

Tho' not inspir'd, oh! may I never be  
Forgetful of my *Pedigree*, or thee.

cases the *pedigrees*, obscure though they may be, of a very  
large number of horses and mares of note from the earliest  
accounts.

*Enye. Brit.*, XII. 183.

= **Syn.** *Pedigree*, *Genealogy*, *Lineage*. *Pedigree* may be  
used with reference either to a person or to an animal, as  
the *pedigree* of a horse; the others only to a person or  
family. In some cases it extends to geologic time: as, the  
*pedigree* of Cenozoic horses. *Genealogy* is the series of  
generations, coming down from the first known ancestor.  
*Lineage* views the person as coming in a line of descent,  
generally honorable, which, however, need not be traced,  
as in a *genealogy* or *pedigree*. *Pedigree* and *lineage* are  
generally narrower words than *genealogy*, the last  
usually covering some personal history and including de-  
tails of various matters of interest to the persons or fam-  
ilies concerned.

**pedigreed** (ped'i-grēd), *a.* [*< pedigree + -ed*].  
Having a distinguished pedigree. [Rare.]

**Pedilanthus** (ped-i-lan'thus), *n.* [NL. (Necker,

of the apetalous order *Euphorbiaceae* and the  
tribe *Euphorbieae*, known by the irregularly  
minutely toothed oblique or urn-shaped involucre.  
There are about 15 species, all American, from Mexico  
and the West Indies to northern Brazil. They bear fleshy  
branches, with an acrid milky juice, alternate stem-leaves  
and opposite floral leaves, and flowers surrounded by  
greenish or colored involucre, arranged in terminal or  
axillary cymes. Several species are cultivated as ever-  
green shrubs in greenhouses, and from the shape of the  
involucre are known as *slipper-plants*. *P. titimbalensis*,  
of the West Indies and South America, known as *jeu-  
bush*, is used in medicine as an emetic.

synonym of *Prosimiae*, *Lemuroidea*, and *Streps-  
sirrhina*. Also *Pedimani*. *Vicq-d'Azur*, 1792.—  
2. A group of marsupial or didelphian mam-  
mals, the American opossums: so called from the  
hand-like structure and function of both

mals.

In arch., a low triangular part resembling a  
gable, crowning the fronts of buildings in the  
Greek styles, especially over porticos. It is sur-  
rounded by a cornice, and its flat recessed field or tym-  
panum is often ornamented with sculptures in relief or in  
the round. Among such sculptures are found the finest  
remains of Greek art: the pediment-figures of the Par-  
thenon, by Phidias. In the debased Roman and Renais-

Eastern Pediment of the Temple of Zeus at Olympia.  
(Curtius Grottius restoration.)

sance styles the same name is given to gables similarly  
placed, even though not triangular in form, but semicir-  
cular, elliptical, or interrupted, and also to small finish-  
ing members of any of these shapes over doors or win-  
dows. In the architecture of the middle ages small gables  
and triangular decorations over openings, niches, etc., are  
often called *pediments*. These generally have the angle  
at the apex much more acute than the corresponding  
gable or gablet in Roman architecture, which, on its part,  
is markedly higher in proportion, or less obtuse-angled  
at the summit, than Hellenic pediments. See also cuts  
under *acrotorium*, *octastyle*, and *pedimented*.

Some of the entrances are adorned with *pediments* and  
entablatures cut out of the rock.

*Pocock*, Description of the East, II. i. 48.

of protecting an opening from the wet.

*J. Ferguson*, Hist. Arch., 1. 33.

Hence—2. In *decorative art*, any member of simi-  
lar outline, forming a triangular or segmental  
ornament rising above a horizontal band, as in  
ironwork; such a member above the opening  
of a screen or the like: it may be entirely open  
and consist of light scrollwork only.

**pedimental** (ped-i-men'tal), *a.* [*< pediment +  
-al*.] 1. Relating to or of the nature of a pediment;  
found on a pediment; designed to be  
used in a pediment.

Intermixed with these architectural remains were the  
sculptures of the temple, those very *pedimental* sculptures  
and metopes of which Pausanias has given us a brief but  
infinitely precious description.

*C. P. Newton*, Art and Archaeol., p. 335.

On the theory of a *pedimental* composition [for the Niobe  
group], the prostrate son would occupy one angle, and  
would presuppose a prostrate  
daughter in the opposite angle.  
*J. S. Murray*, Greek Sculpture,  
[II. 319.]

2. Having the form of a  
pediment. Thus, the head-  
dress worn by women in the six-  
teenth century, in which a ker-  
chief or band is folded over the

jecting upward, is commonly

*pedimental head dress*.

a feeler, palp.] 1. *a.* 1. A maxillary palp, or max-  
illary palpus; the palp of an arachnid. A pair of  
pedipalps is a characteristic feature of most arachi-  
dians. They are borne on the head, in front of the usual  
four pairs of ambulatory legs. In scorpions and their al-  
lies, and also in the false scorpions, the pedipalps usually  
attain great size, and may be chelate or end in a pincer,  
like the large claw of a lobster. They are efficient tactile  
and prehensile organs. See cuts under *Araneida*, *Pedi-  
palpi*, *Phryganida*, and *scorpion*.

2. A pedipalpe arachnid.—**Inflated pedi-

arachnid order  
*Arthrogastra*, con-

*Phryganida* and *The-  
lyphonida*, common-  
ly known as *whip-  
scorpions*. They have  
eight ocelli, two median  
and three on each side.  
The short chelicerae are  
two-jointed, while the  
palpi are large and long,  
ending in more or less  
perfectly formed pin-  
cers. The first pair of  
legs is longest, and the  
tarsus is broken into a  
long series of joints. In  
a former system when  
the *Pedipalpi* also in-  
cluded the true scorpions,  
the term was syn-  
onymous with *Pedimo-  
rosomatia* and coexten-  
sive with *Arthrogastra*.  
The group is now rated  
as an order of *Arachnida*, divided into 2 suborders, *Am-  
blipugi* and *Uropugi*, respectively exemplified by the  
above-named families. See also cut at *Phryganida*.

It is to this body of select hereditary barons, joined with the prelates, that the term "peers of the land" properly belongs; an expression which occurs first, it is said, in the act by which the Despensers were exiled, but which before the middle of the fourteenth century had obtained general recognition as descriptive of members of the house of lords. **Pelagianism** (pé-lá'ji-an-izm), *n.* [C. *Pelagian<sup>2</sup>* + *-ism*.] The doctrines of Pelagius, a British monk (flourished about A. D. 400), and his followers. They held that there was no original sin through Adam, and consequently no hereditary guilt, that every soul is created by God sinless, that the will is absolutely free, and that the grace of God is universal, but is not indispensable; and they rejected infant baptism. Pelagius, however, held to the belief in the Trinity and in the personality of Christ. His views were developed by his pupil Celestius, but were anathematized by Pope Zosimus A. D. 415. Pelagianism was the principal anthropological heresy in the early church, and was strongly combated by Pelagius's contemporary Augustine.

**pelagic** (pé-lá'j'ik), *a.* [C. Gr. *πелаγικός*, pertaining to the open sea, C. *πелаγος*, the sea, the open sea.] Marine; oceanic; of or inhabiting the deep or open sea: said of those aquatic plants and animals which inhabit the high seas. Also *pelagium*.—**Pelagic birds**, the petrel family, *Procellariidae*.—**Pelagic fauna**, as used by modern thalassographic zoologists, the fauna living at or near the surface of the ocean at some distance from land.

The *pelagic fish fauna*, as defined by the author [John Murray], consists, first, of the truly pelagic fish, those which habitually live on the surface of the ocean. . . . Secondly, there are a number of fishes inhabiting the depths of the ocean, from a hundred fathoms downwards, which seem periodically to ascend to the surface, possibly in connection with their propagation. Thirdly, the *pelagic fauna* receives a very considerable contingent from the littoral fauna.

They have a simple cross-shaped mouth, 4 folded peritradial mouth-arms, simple broad radial marginal pouches without branched distal canals or ring-canal, 8 marginal bodies, and 16, 32, or more marginal flaps. Also *Pelagidae*.

**pelagite** (pél'aj-it), *n.* [C. Gr. *πελαγιτης*, the sea, + *-ites*.] A name given to the mangiferous nodules brought up by dredging in the deep parts of the Pacific ocean. They consist largely of oxides of manganese and iron, but have not a definite mineralogical composition.

There are no basipterygoid processes; the palatines usually unite behind the postnares; the maxillopalatines are large and spongy; the mandibular angle is truncate (except in the *Hemipodides*); the sternum is broad, and has two or four notches; the hallux is neither versatile nor webbed; and

are known specifically as *pelargomorphs* or as *Martha Washington geraniums*; other species are the single and double-flowering geraniums of house culture, of which leading forms are the hoarsehoes, ivy-leaved, oak-leaved, lemon, rose, silver, gold, and bronze-leaved, and tricolor geraniums. *P. tokei* produces tubers which are eaten at Cape Colony. An essential oil is made from the leaves of several species, especially in Algeria, of *P. adnigrissimum*. See *geranium* 3.

Stork-billed Kingfisher (*Pelargopsis gurneyi*).

This remarkable form has usually been placed with *Halcyon* in the dactyloine series, but it is near *Ceryle* in form, as well as in the piscivorous habits of the genus. About 8 species inhabit the Indian and Australian regions, in one of which (*P. melanochrysa*) the bill is black; in the rest it is red, as *P. gurneyi*, *P. leucophaea*, etc. Also called *Khamphaleya* and *Halcyon*.

**Pelasgi** (pē-las-'ji), *n. pl.* [*L.*, < *Gr. Pelasgion*, the Pelasgi, traditionally derived from *Πελαγος*, a son of Zeus and Niobe, the eponymous founder of the Pelasgian race.] An ancient race, widely spread over Greece and the coasts and islands of the Aegean Sea and the Mediterranean generally, in prehistoric times. The accounts of it are in great part mythical and of doubtful value, and its ethnological position is uncertain.

**Pelasgian** (pē-las-'ji-an), *a. and n.* [*< Gr. Pelasgion*, equiv. to *Πελαγον*, Pelasgi; see *Pelasgic*.] *I. a.* Same as *Pelasgic*.

The name has been used as nearly synonymous with that of the order, and variously restricted; it is now usually confined to the single genus *Pelecanus*, and includes only the pelicans. See cut under *pelican*.

**Pelecanoides** (pel-'e-kan-'oi-dēz), *n.* [*N.L.* (Lacépède, 1800–1), < *Gr. pelagios*, a pelican, + *-oides*, form.] A singular genus of the petrel family, *Procellariidæ*, representing the subfamily *Pelecanoidinæ* (or *Halodrominæ*); so called from the width of the chin and distensibility of the throat, suggestive of a pelican's pouch. The bill is broad, and the nasal tubes are vertical, the nostrils opening directly upward, unlike those of any other petrel, and the wings are short, contrary also to the rule in this family. The birds dive with facility, and resemble little auks rather than petrels. Two or three species inhabit southern seas, as *P. acridictus*. The genus is also called *Halodroma* and *Puffinara*.

**Pelecanoidinæ** (pel-'e-kan-'oi-di'no), *n. pl.* [*N.L.*, < *Pelecanoides* + *-inæ*.] A subfamily of *Procellariidæ*, represented by the genus *Pelecanoides* alone. Also called *Halodrominæ*.

**Pelecanus** (pel-'e-kan-'us), *n.* [*N.L.*, < *L.L. pelicanus*, *pelicanus*, a pelican; see *pelican*.] The

only genus of *Pelecanidæ*, having the bill slender and several times as long as the head, with a hook or nail at the end, and the mandibular rami divaricated, supporting an enormous pouch. The wings are extremely long, with very numerous remiges. The tail is short, and consists of three more feathers; the feet are short and stout, and all four toes are webbed. (See cut under *pelican*.) The size is great, and the form is robust. The weight of the body in proportion to its bulk is reduced by its great pneumaticity. There are at least a perfectly distinct species, and some authors admit a few. Two inhabit the United States, the white and brown pelicans, *P. trochiloides* and *P. jesus*. (See cut under *pelican*.) The European species, inhabiting also Asia and Africa, are *P. oncorhynchus* and *P. crispus*. The Australian is *P. oncorhynchus*; and *P. rufescens* or *phillipinus* is found in various parts of the old world.

The trochanters are one-jointed; the fore wings are without complete submarginal cells; the abdomen is petiolate, very long and slender, in the female at least five times longer than the head and thorax, but shorter in the male, and clavate; the antennae are long, filamentous, not elbowed, and the body is polished black.

*II. n.* A bivalve mollusk; a lamellibranch. **Pelecypoda** (pel-'es-'i-pō-dē), *n. pl.* [*N.L.*; see *pelecypod*.] The bivalve mollusks; the conchiferous or accephalous bivalves, usually called *Lamellibranchiata*, *Acphala*, or *Conchifera*; so named as a class from the shape of the foot in some forms. Goldfuss. This name, agreeing in termination with the names of other molluscan classes, is now preferred by some conchologists to any of the prior designations.

Another of our vulgar makers spake as oftentimes in this verse written to the dispense of a rich man and courteous. Thou hast misers made (thou hast a prince's pelf) — a levee term to be spoken of a prince's treasure, which in no respect nor for any cause is to be called *pelf*, though it were never so mean, for *pelf* is properly the scraps or shreds of taylor and skinner, who have accumulated so vile a price as they have commonly cast out of doors, or otherwise bestowed upon base persons.

The character of the group is best shown by some stork, as, for example, the Indian and African episcopal stork, *Dissoura episcopus*, whose generic name, however, indicates a remarkable peculiarity of the tail, which is black and forked, with long white under tail-coverts projecting beyond the true tail-feathers, as illustrated in the figure. There are about 175 species, or as some estimate over 400, of which about 10 are found in northern Africa, the Orient, and Australia, and all the others in South Africa. They are herbs or shrubs, often viscid-pubescent and odorless, sometimes fleshy, bearing opposite undivided or dissected leaves, and flowers of scarlet, pink, white, or other colors, usually conspicuous, and in umbels. Many species are cultivated for their handsome flowers or fragrant leaves, and from their strong tendency to hybridize these have produced very numerous varieties, those of *P. grandiflorum*

**pelican** (pel'i-kan), *n.* [Formerly also *pellican*, *pelican*; *< ME. pelican, pelican, pelican, pelican, pelican, < AS. pelican = F. pelican = Pr. pelica, pelican = Sp. Pz. pelicano = It. pellicano = D. pelikan = G. Sw. Dan. pelikan, < LL. pelicanus, pelicanus, < Gr. πικύρα, MGr. also πικύρα, πικύρα, or πικύρα, a pelican. Cf. πικύρα (πικύρα), a woodpecker. < πικύρα, bew or shape with an ax, < πικύρα = Skt. parāṇ, an ax, a battl-ax.] 1. A large piscivorous natatorial bird of the family *Pelecanidae* and genus *Pelecanus*, having an enormously distensible gular pouch. Pelicans of some species are found in nearly all temperate and tropical countries. Deriving their whole sustenance from the water, they frequent lakes, rivers, and sea-coasts, and generally secure their prey by wading or swimming and scooping it into their pouches; though some, as the brown pelican, swoop down on the wing like gannets. They breed usually on the ground near water, laying from one to three eggs, white-colored, equal-ended, and of rough texture. They are gregarious, and gather in immense companies at their breeding-resorts. The birds are about as large as swans, and their short legs constrain them to an awkward waddling gait, but their flight is easy, firm, and protracted. The sexes are colored alike. The plumage is in most cases white, variously tinted with yellow and rosy hues. The American white pelican, *P. trachyrhynchus*, is five feet long and eight or nine feet in extent of wings; the general plumage is white, with black primaries, and yellow lengthened plumes on the back of the head and on the breast. The bill is surmounted in the breeding season by a curious horny crest which is deciduous. (See cut at *rough billed*.) The brown pelican, *P. fuscus*, is of dark and varied colors, and rather smaller than the white species. The fable that the pelican wounds its own breast and feeds its young with the blood that flows from it has no foundation in fact so far as this bird is concerned. The young are fed on fish brought to the nest in the pouch, and doubtless often macerated to some extent in the gullet—a habit common to the other birds of the same order, as cormorants, gannets, etc. The myth probably arose in connection with the fabulous phoenix, and may have been borne out by some facts which have been observed in the case of the flamingo (*Phoenicopterus*) possibly furthermore acquiring some plausibility in its application to the pelican, from a red tint that is observable on the beak or plumage of some species. The pelican has from early times been considered as an emblem of charity. See also cut under *foliulmote*.*

**pelvis** (pel'vis), *n.*; pl. *pelvices* (-vēc). [NL. < L. *pelvis*, a basin, laver; cf. Gr. *πέλις*, *pelis*, *pelis*, a bowl; see *pelike*.] 1. A bony basin forming the most inferior or posterior one of the three great cavities—thoracic, abdominal, and pelvic—of the trunk of most terrestrial vertebrates. A perfect pelvis is formed on each side by the haunch-bones, consisting of ilium, ischium, and pubis, meeting in front at the pubic symphysis, and completed behind by the sacrum, with which the iliac bones articulate, and by more or fewer coccygeal or caudal vertebrae. But the pubic symphysis is wanting, as a rule, in animals below mammals; there is sometimes an ischiae and often an iliac symphysis. In any case, a recognizable ilium or ischium or pubis, however rudimentary, constitutes in so far a pelvis. The human pelvis is complete, and

of normal composition, but remarkable for its shortness, width, axial curvature, and obliquity with reference to the long axis of the body. A perpendicular to the plane of the inlet would leave the abdomen at the umbilicus, and a perpendicular to the plane of the outlet would strike the promontory of the sacrum. The pelvis is divided into *true* and *false*—the latter being that part which is above the iliopectineal line, the former below the same line, which thus represents, in part, the brim or superior strait of the true pelvis. The false pelvis is broad and shallow, composed, as far as bone is concerned, chiefly by the flaring iliac fossae, its front wall being made by the lower part of the abdominal parietes; and in the erect attitude the mass of abdominal viscera rests largely upon this part of the basin. The true pelvis is more contracted, and chiefly bony as to its walls. Its inlet or superior plane, cordiform in shape, is circumscribed by the pelvic brim, which is formed by the iliopectineal crest, completed in front by the spine and crest of the pubes, and behind by the curved ridge and promontory of the sacrum. The lower plane, or outlet, known also as the inferior strait, is bounded by a very irregular line of bone, the point of the coccyx being

From the side, 1, crest of ilium; 2, surface for articulation with os innominatum; 3, crest of ilium; 4, narrow part of ilium; 5, acetabulum for hip joint; 6, a small part of right pubis; 7, ischium.

in the middle line behind, and the tuberosity of the ischium on each side, between which three points the bony outlet is deeply emarginated behind, on each side, by the great sacrospinous notch, and in front by the arch of the pubes, formed by the conjoined rami of the pubes and ischia. In life these notches are largely filled in by ligaments (the greater and lesser sacrospinous ligaments on each side, and the triangular or infrapubic ligament in front). The obturator membrane also closes in

what would otherwise be a large vacancy on each side, the obturator foramen. The inlet of the pelvis is not closed by any structure; but the outlet is floored by the levator ani muscle, the skin of the perineum, and associated soft parts. The pelvic cavity contains the lower bowel and most of the organs of generation. After puberty the male and female pelvis differ usually to a recognizable extent in size and shape; that of the male being more massive and contracted, that of the female lighter and more expansive. See also cuts under *Catarrhoid*, *Dromedary*, *Elephantine*, *Equine*, *Innominate*, *Ligament*, *Ornithoscedid*, *or*, *quarter*, and *sacrum*.

3. [*cap.*] A genus of mollusks.—**Brim of the (true) pelvis**, the periphery of the pelvic inlet, separating the false from the true pelvis. It is now made of beef, especially for use in arctic expeditions, being an easily preserved food, which keeps for a long time and contains the largest amount of nutriment in the smallest space. Pemmican is similar in character to the tassage of South America and the biltong of southern Africa.

Pemmican is made from the round of beef cut in strips and dried, then shredded or mixed with beef tallow and currants. Seeley and Soley, Rescue of Greeley, p. 132.

cut to a point and split at the nib, used for  
writing; now, by extension, any instrument  
(usually of steel, gold, or other metal) of similar  
form, used for writing by means of a fluid ink.

Various forms of Pens.  
1, quill pen, in which a is the feather, b the body, c the nib;  
2, steel pen and penholder, a being the handle, b a ferrul, f and a  
and having a clamping socket into which the pen is inserted and  
there held by pressure; 3 and 4, fountain pens, the body of the  
handle a is a hollow reservoir for ink, b is the pen-holding device,  
c and d are metal rods passing through small hole into the ink  
reservoir, along which the ink flows by capillary action to keep the  
pen supplied.

Pens of steel or gold have almost superseded the old quill  
pens. Pens are also manufactured to some extent of other  
metallic substances, such as silver, platinum, and alumi-  
num bronze. Gold pens are usually tipped with a native  
alloy of osmium and iridium. They possess the advantage  
of being incorrodible by ink, besides having a fine, quill-  
like flexibility, and are exceedingly durable.

**3.** *Eccles.*, sorrow for sin shown by outward acts under authority and regulation of the church; contrition manifested by confession and satisfaction and entitling to absolution; hence, absolution ensuing upon contrition and confession with satisfaction or purpose of satisfaction. Absolution has been given on these terms since primitive times in the church, and this ancient institution was afterward formally recognized as a sacrament by the Roman Catholic, the Greek, and other churches. The sacrament of penance includes four parts: contrition, confession, satisfaction, and absolution. It is required that there should be a genuine and a supernatural contrition for the sin committed—that is, a sorrow produced by the influence of the Holy Spirit, coupled with a firm purpose of amendment; that the sin should be confessed fully and unreservedly to a priest; and that satisfaction be made for it by a voluntary submission to such penalty or discipline as the priest may require and by restitution to persons wronged; and absolution can be granted only on these conditions. It can be administered by no one who has not received priest's orders. Every member of the Roman Catholic Church is obliged at least once a year to confess to his parish priest and to do penance under his direction; he cannot partake of communion without previous absolution, but is not either before confession or during his penitential discipline regarded as under ecclesiastical censure, which is inflicted on the contumacious only.

**4.** The penalty or discipline imposed by the priest in the above sacrament.

See *searje* and *flagellum*.—**To do penance**. (a) To repent: obsolete except in the Douay version of the Bible, and in the usage of the Roman Catholic Church.

the dome by two semicircular or ogival vaults, intersecting at right angles. Upon the pendentives is supported, in place of the upper part of the dome of which they are segments, an independent dome of which the diameter is equal to that of the absent upper part of the first dome, or sometimes a lantern or a tower. The true pendentive is characteristic of Byzantine architecture, and is still commonly used in the various Oriental architectures based upon the style of building of the Greek empire. In it was found the solution of the problem of covering a rectangular space with a vault of circular plan. called the *period of oscillation* of the pendulum. A *simple pendulum* in the mechanical sense is a material particle suspended by a weightless rod and moving without friction. A single weight attached by a string, etc., approximates to an ideal simple pendulum. The period of oscillation of a simple pendulum in vacuo is

$$\pi \sqrt{\frac{L}{g}} (1 + \frac{1}{16} \frac{A^2}{L^2} + \dots)$$

where  $\pi = 3.14159$ ,  $g$  is the acceleration of gravity,  $L$  is the length of the pendulum, and  $A$  is the total arc of oscillation. The quantity in parentheses is not affected by the radical sign. It will be seen that, unless the arc is very large, the period is almost independent of its magnitude. A *compound pendulum* is any pendulum not simple. The same formula for the period applies. Using the square of the radius of gyration divided by the distance of the center of gravity from the axis of rotation. The common clock pendulum usually consists of a rod of metal or wood, suspended so as to move freely about the point of suspension, and having at its lower end a piece of brass or other heavy material called a *bob*, attached to its lower end. The metal rod, however, is subject to variations in length in consequence of changes of temperature, and, as the accuracy of the pendulum considered as a regulating power depends upon its always maintaining the same length, various combinations of two different metals, as brass and steel, under the name of *compensation pendulums*, have been adopted in order to counteract the effects of changes of temperature. These take particular names, according to their forms and materials, as the *gridiron pendulum*, the *mercurial pendulum*, the *lever pendulum*, etc. The *gridiron pendulum* is composed of parallel rods of brass and steel, arranged in one plane, and so connected together that the different degrees of expansion of the different metals compensate each other and maintain the compound rod of fixed length. The *mercurial pendulum*, devised by Graham, consists of one rod with a vessel containing mercury at the lower end, so adjusted in quantity that, whatever alterations take place in the length of the pendulum, the center of oscillation remains the same, the mercury ascending when the rod descends, and vice versa. Another form of compensation or compensating pendulum employs a curved bar composed of iron and brass brazed together, which is attached to the rod in a horizontal position, the brass downward. The unequal expansion of the metals under a rise of temperature tends to lift the center of gravity of the bob, and thus to compensate for the simultaneous increase in length of the rod. The pendulum is of great importance as the regulating power of clocks. Our clocks are nothing more than pendulums with wheel-work attached to register the number of vibrations, and with a weight or spring having force enough to counteract retarding effects of friction and the resistance of the air. A *reversible pendulum* is a pendulum so arranged that it may be suspended from either of two axes on its length at unequal distances from its center of gravity, and so placed that in the two positions each becomes axis of suspension and axis of oscillation, so that the time of vibration shall be the same in both positions. Bessel's reversible pendulum is symmetrical in external figure with respect to the plane equidistant from the two axes. Such a pendulum diminishes the effect of the atmosphere. A pendulum which makes exactly one oscillation per second is called a *seconds pendulum* (also written *seconds' pendulum* and *second's pendulum*). The length of a pendulum is the length of the simple pendulum having the same period—that is, the distance between the point of suspension and the center of oscillation (see *center*). In the latitude of New York, and at the level of the sea, the length of the seconds pendulum is 39.1 inches nearly. As the force of gravity diminishes toward the equator and increases toward the poles, the seconds pendulum is shorter in lower latitudes and longer in higher. Besides its use as a regulator in clocks, the pendulum is applied to determine the relative and absolute acceleration of gravity at different places, and in this way the figure of the earth.

3. A chandelier or lamp *pendent* from a ceiling.—4. A guard-ring of a watch and its attachment, by which the watch is attached to a chain.—**Axis of oscillation of a pendulum**. See *axis*.—**Ballistic pendulum**. See *ballistic*.—**Conical pendulum**, a pendulum not restricted to move in one plane, the center of gravity being only restricted to the surface of a sphere.—**Cycloidal pendulum, a pendulum so constructed as to vibrate in the arc of a cycloid instead of a circular arc, like the common pendulum. The vibrations of such a pendulum are perfectly isochronous.—**Electric pendulum**. (*a*) See *electric*. (*b*) A pendulum that at some point of its path closes a circuit, thus in turn either reporting the beats of the pendulum at distant stations for time comparisons, or directly controlling a number of clocks. See *electric clock*, and *electric clock*.—**Foucault's pendulum**, a conical pendulum with a very long wire and a heavy bob, designed to show the revolution of the earth. At the north pole, the plane of oscillation really remaining fixed, would appear to rotate about the vertical once in twenty-four hours. At the equator there would be no such effect, and at other latitudes there should be a slower rotation. See *compensation of rotations*, under *pendulum*.—**Gyroscopic, hydrometric, etc. pendulum**. See the adjectives.—**Invariable pendulum**, a pendulum intended to be carried from station to station, and to be oscillated at each so as to determine the relative acceleration of gravity at those points. This method assumes that the pendulum is not bent nor its knife-edges altered in position or sharpness in the course of transportation. Hence it is called *invariable*, not as being incapable of change, but as being secured against change for a limited time.—**Long and short pendulum**, a pendulum for determining the absolute force of gravity, consisting of a bob suspended by a wire the length of which**

can be varied by a measured amount. **Pendulum ferry-boat**, a ferry boat that is swung from bank to bank of a river by the force of the current, requiring but little labor to guide or propel it. Boats on this principle are made fast to an anchor or to moorings placed upstream in the middle of the river. **Pendulum governor**, in *mech.*, a governor consisting of two revolving pendulums, of equal length and weight, attached to a spindle, the spindle and the pendulums having a common axis of rotation, and the spindle being driven by the motion of the engine or machine to be controlled. The angular velocity of revolution of the pendulums bears a constant ratio to the velocity of the prime mover. The pendulum rods or arms are thus made to take and hold a definite angle with the axis of their revolution, so long as the speed of the prime mover remains constant. Increase of speed in the latter increases this angle, and decrease of speed diminishes it. The pendulum arms are connected by links to a collar that slides on the spindle, and the motion of this collar is made to regulate a valve supplying steam or gas to an engine, a belt-shift that moves a belt on cone-pulleys, or mechanism controlling the partial opening or closing of a gate supplying water to a wheel, etc. The supply of power is thus varied according to requirements, and the variation in velocity is confined to narrow limits. See *governor*, 6. **Pendulum press**, a punching-press in which the punch is driven into the die by a swinging pendulous lever usually having a ball or weight at the lower end, and actuated by the foot of the operator, while with his hands he holds the piece to be punched. **Pendulum pump**. According to one view < *W. pen gwen*, 'white head,' the name being given to the auk in ref. to the large white spot before the eye, and subsequently transferred to a penguin. According to another view, *penguin* or *pinguin* is a corruption (in some manner left unexplained) of *E. dial. penning* or *pinning*, the pinion or outer joint of the wing of a fowl (< *pen<sup>2</sup>*, quill, + *wing*): this name being supposed to have been given orig. to the great auk (in allusion to its rudimentary wings) and afterward transferred to the penguins.] It. The great auk. *Alca impenensis*: the original sense.—2. Any species of the family *Spheniscidae* or *Aptenodytidae*. (See *Spheniscidae* for technical characters.) Penguins are remarkably distinguished from all other birds by the reduction of the wings to mere flippers, covered with scaly feathers (see *Impeanes*, *Spheniscus*), used for swimming under water, but unfit for flight. The feathers of the upper parts have also broad flattened shafts and slight webs, being thus like scales; the feet are webbed and four-toed, though the hind toe is very short, the tail is short and stiff; the general form is stout and ungainly. On land the birds stand nearly erect and waddle clumsily, but they are agile and graceful in the water. They feed on fish and

other animal food, and congregate on shore to breed in penguineries of great extent. Penguins are confined to the southern hemisphere, especially about Cape Horn and the Cape of Good Hope, and islands in high southern latitudes, coming nearest the equator on the west coast of South America, as in the case of Humboldt's penguin of Peru. There are more than a dozen species, referable to three

(See *emper.*) *Jackass penguins*, so called from braying, are medium-sized or rather small, with stout bill, as *Spheniscus demissa* of South Africa and *S. magellanicus* of Patagonia. (See *cut* at *Spheniscus*.) None of the foregoing are crested; but the members of the genus *Endiptyx* (or *Catharactes*, as *E. chrysocoma* or *chrysodophus*, known as *ruck-choppers* and *meerkats*, have curly yellow plumes on each side of the head. (See *cut* at *Endiptyx*.) Other medium-sized penguins are *Pygoscelis bennetti*, *P. antarctica*, *P. adelpus*, and *Diomedea exulans*. The smallest penguin, about a foot long, is *Endiptyx minor* of Australian and New Zealand shores. The largest, which was taller than a man usually is, is a fossil species named *Talavadyptes antarcticus* from the New Zealand Tertiary.

**2. Eccles.**, one who makes confession of sin and undergoes, under priestly direction, the ecclesiastical discipline prescribed for its absolution. The penitents were classified in four grades—mourners, hearers, kneelers, and standers or consistentes. Owing to the change of circumstances and the relaxation of discipline, public confession gradually ceased to be required, but private confession of mortal sins has been considered necessary in the Roman Catholic Church and of divine obligation. The Greek Church still requires confession for all grave sins, but its discipline is not so strict as that of the Roman Church. See *penance*.

It was probably with this figure that the Pythagoreans began their letters, as a symbol of health. In modern English books it is generally assumed that this is the six-pointed star formed of two triangles interlaced or superposed. (Compare *Solomon's seal*, under *seal*.) Obviously, the pentacle must be a five-pointed or five membered object, and it should be considered as equivalent to the *pentagram* or *pentapla*. (See also *pentangle*.) The construction of the five-pointed star depends upon an abstruse proposition discovered in the Pythagorean school, and this star seems to have been from that time adopted as their seal.

This extensive family has been divided into 8 subfamilies, *Acanthosomatinae*, *Enderessinae*, *Pentato-*

*minae*, *Scincorinae*, *Holydiniae*, *Phibriae*, *Asopinae*, and *Cyd-ninae*, when the last is not made a distinct family. Also *Pentatomida*, *Pentatomides*, *Pentatomites*.

**pentatomine** (pen-tat'ō-mīn), *a.* Of or pertaining to the *Pentatominae*.

**pentatone** (pen-ta-tōn), *n.* [*Gr.* πεντάτονος, of five tones, *< πέντε*, five, + τόνος, tone.] In *ancient and medieval music*, an interval containing five whole steps—that is, an augmented sixth. Compare *tritone*.

They are of Paleozoic, and especially Carboniferous, age. Very different limits have been assigned to the family. (a) By D'Orbigny, 1832, it was intended to include all the regular blastoid crinoids. (b) By Etheridge and Carpenter it was limited to regular blastoids with base usually convex, five spiracles whose distal boundary is formed by side plates, and hydrospires concentrated at the lowest part of the radial sinus.

**pentavalent** (pen-tav'ā-lent), *a.* [*Gr.* πέντε, five, + *L.* valen(-t)s, *ppr.* of *valere*, be strong, have power; see *value*.] In *chem.*, capable of combining with or saturating five univalent elements or radicals; applied both to elements and to compound radicals. Thus, in the case of phosphoric pentachlorid (PCl<sub>5</sub>), phosphorus is said to be *pentavalent*, because one atom of phosphorus unites with five atoms of univalent chlorine.

**pentecoster** (pen-tē-kon-tēr), *n.* [*Gr.* πεντηκοστήριος, also πεντηκοστόρος, with fifty oars, *< πέντε*, fifty, + ὄρος, *ppr.* in ἑντηρόν, an oar; see *oar*.] An ancient Greek ship of burden carrying fifty oars.

**Pentecost** (pen-tē-kost), *n.* [*ME.* *pentecoste*, *< OF.* *pentecoste*, *F.* *pentecôte* = *Sp.* *pentecostas* = *Port.* *pentecoste*, *pentecostas* = *It.* *pentecosta*, *pentecoste*, *AS.* *pentecosten* = *OS.* *pentecoston* (dat.) = *OFries.* *pinkosta*, *pinksta* = *D.* *pinkster*, *pinksteren* (> *E.* *pinkster*) = *MLG.* *pinkste*, *pinkster*, *pinksteren* = *OHG.* *ʾpinkustin* (dat.), *ʾpinkustin* (simulating *ʾfif* = *E.* *five*). *MHG.* *phingesten*, *phingsten*, *G.* *phingsten* = *Sw.* *pingst*, = *Dan.* *pingst*, *< LL.* *pentecoste* = *Goth.* *pinkte-kuste*, *< Gr.* πεντηκοστή, *Pentecoste*, the fiftieth day after the Passover, lit. fiftieth (see *ἡμέρα*, day), *< πέντε*, fifty; see *fifty*.] 1. In the New Testament, a Jewish harvest festival called in the Old Testament (*Deut.* xvi. 10, etc.) the *feast of weeks* (Hebrew *Shabuoth*), and observed on the fiftieth day after the 14th of Nisan, the date of the celebration of the Passover. The feast of Pentecost, while primarily connected with the celebration of the completion of harvest, by the offering of first fruits, etc., seems also to have been associated in the minds of the later Jews with the giving of the law on the fiftieth day after their departure from Egypt. It always precedes the Jewish New Year by 113 days.  
 2. The feast of Whitsunday, a festival of the Christian church, observed annually in remembrance of the descent of the Holy Ghost upon the apostles during the feast of Pentecost. Pentecost is the third of the great Christian festivals, the other two being Christmas and Easter. It is connected with its Jewish predecessor, not only historically (Acts ii. 1-11), but also intrinsically, because it is regarded as celebrating the first fruits of the Spirit, as the Jewish Pentecost celebrated the first fruits of the earth (*Lev.* xviii. 17). In the primitive church the term *Pentecost* was used both for Whitsunday and for the whole period of fifty days ending with Whitsunday.

*Pentecost*, day of rejoicing, had come.

of the luminous body. The figures represent the so called Hipparchian diagrams of a lunar and a solar eclipse. Any portion of the moon in penumbra appears slightly dimmed, the more so the nearer it is to the umbra. At a station of the earth in the moon's penumbra, the disk of the sun is partially hidden, forming a partial (or possibly, an annular) eclipse.

If the source of light be a point, the shadow is sharply defined, if the source be a luminous surface, the perfect shadow is fringed by an imperfect shadow called a *penumbra*.

— *Swift, Panegyric on the Dean*.

**=Syn. 3.** *Parsimonious*, *penurious*, *misery*, *close*, *niggardly*, *stingy*, *mean*, covetous, avaricious, illiberal, sordid, chury. The first seven words express the spirit or conduct of those who are slow to part with money or other valuable things. *Parsimonious* is perhaps the most general of these words, literally sparing to spend, but always careful and excessively sparing. *Penurious* means literally in penny, but always feeling and acting as though one were in poverty, saying beyond reason; the word is rather stronger than *parsimonious*, and has perhaps rather more reference to the treatment of others. One may be *parsimonious* or *penurious*, through habits formed in times of having little, without being really *misery*. *Misery*, feeling and acting like a miser, is generally applied to one who, having some wealth, clings to it for fear of poverty, or in provision for some possible exigency of the future, or especially for its own sake, as delighting in the mere possession of wealth. *Close* has the vigor of figurative use; it may be a shortening of *close fist*. *Niggardly* is the least limited to money, and has the most to do with others; it expresses a meanly parsimonious treatment of others, a neglectful, self-defeating or stingy saving. *Stingy* expresses the most of opprobrium; as, Queen Elizabeth was called *stingy* by her friends, *stingy* by her enemies, and *parsimonious* by the rest of the world. It indicates a grudging, narrow-hearted or unreasonable parsimony in giving or providing. *Mean* shows a tendency toward emphasizing the idea of a close or narrow and mean-spirited handling of money. See *avarice*.

**penuriously** (pě-nū'ri-ūs-ly), *adv.* In a penurious or parsimonious manner; with scanty supply.

The common peony is *P. officinalis*, an herb with large, commonly red flowers, one on a stalk, a native of southern Europe and central Asia. A kindred species, *P. tenuifolia*, of Siberia and parts of Europe, has the leaves finely cut, and hence is called *slender-leaved*, *finely-leaved*, *fern-leaved*, or *finest peony*. A second typical species is the tree-peony, *P. moutan*, a taller shrubby species from China, where it is a favorite, with large rose-colored or nearly white flowers, several on a stalk. These and one or two other species furnish the numerous hybrid and other varieties of the gardens, which vary greatly in color and are often double. The root of the common peony was an ancient charm and medicine, and still has some repute as a nerveine.

The word *nation* stands for a political body viewed as a whole. The unity may be ethnic, instead of political; this sense, however, is less common. *Race* is the most common word for all those who seem to make a whole in community of descent and are too numerous to be called a *tribe*, *clan*, or *family*; as, the Anglo-Saxon race is one branch of the Germanic, tracing its descent through certain Low German tribes. *Tribe*, apart from certain peculiar meanings, stands for a subdivision of a race; as, the twelve tribes of Israel; ordinarily the word is not applied to civilized persons; we speak of tribes of Indians, Arabs, Africans. *Clan* is used chiefly of the old organization of kinsmen among the Scotch Highlanders; where used of others, it expresses a similar organization, with intense loyalty and partisanship.

**perceivancer** (pér-sē-'vans), *n.* [*per-* + *perceive*, < OF. *perceivancer*, perception; < *percer*, *perceive*; see *perceive* and *-ance* 1.] Power of perceiving; perception.

Why, this is wondrous, being blind of sight,  
His deep *perceivancer* should be such to know us.  
*Greene*, *George-a-Greene*.

His particular end in every man is, by the infliction of  
pain, damage, and disgrace, that the senses and common  
*perceivancer* might carry this message to the soul within,  
that it is neither easeful, profitable, nor praiseworthy in  
this life to do evil. *Milton*, *Church-Government*, II, 3.

**perceive** (pér-sēv'), *v. t.*: pret. and pp. *perceived*,  
pp. *perceiving*. [*per-* + *perceive*, < ME. *perceiven*, *perceyven*, < OF. *perceivre*, *perceivre*, *perceivre*, *perceivre*,

become aware of; gain a knowledge of (some  
object or fact).

When she it *perceived* she eschewed to come in his pres-  
ence, for she was right a good lady, and full of grace be-  
neath, and right trewe agens hir forde.  
*Martin* (E. E. T. S.), I. 64.

of such goldresses, and hath sent this natural for our  
whetstone. *Shak.*, As you like it, I. 2. 55.

And hedges his own way.  
*Shak.*, *Hen. VIII.*, III, 2. 38.

it by our own understanding, we are in the dark. *Locke*.

I *perceive* you have entered the Suburbs of Sparta al-  
ready, and that you are in a fair way to get to the Town  
itself. *Horrell*, *Letters*, II, 49.

2. Specifically, to come to know by direct ex-  
perience; in *psychol.*, to come to know by virtue  
of a real action of the object upon the mind  
(commonly upon the senses), though the knowl-  
edge may be inferential: know through external  
or internal intuition.

Yit in the air men not see me might,  
And that they now not *perceive* me to sight,  
I shall me appere vpon the erth playn.  
*Room of Parleyng* (E. E. T. S.), I. 3715.

It was in Vallies that I did chiefly *perceive* the Land-  
Winds, which blew in some places one way, in others con-  
trary, or side ways to that, according as the Vallies lay  
pend up between the Mountains.

*Dampier*, *Voyages*, II, iii. 30.

Seeing, hearing, smelling, tasting, and touching or feel-  
ing are words that express the operations proper to each  
sense; *perceiving* expresses that which is common to them  
all.

A man far-off might well *perceive* . . .  
The hard earth shake, and a low thunder of arias.  
*Tennyson*, *Lancelot and Elaine*.

When we talk of *perceiving* we generally refer to knowl-  
edge gained at the time through one of the higher senses,  
and more particularly sight.

*J. Sully*, *Outlines of Psychol.*, p. 154.

=Syn. *Observe*, *Notice*, etc. See *see*.

**perceiver** (pér-sēv'), *n.* [*per-* + *ceive* + *-er* 1.]

rupt form, simulating *perseverance*); < OF. *per-*  
*severance*, an irreg. var. of *perseverance*, *perceiv-*  
*ance*; see *perseverance*.] 1. Perceivance; per-  
ception.

For his diet he [Ariosto] was very temperate, and a great  
enemy of excess and surfeiting, and so careless of delicacies  
as though he had no *perceivance* in the tastes of meats.  
*Sir J. Harrington*, *Life of Ariosto*, p. 418 (quoted in *Trench*).

2. Appearance perceived.

He [Emilius Paulus] suddenly fell into a raving (with-  
out any *perceivance* of sickness set in him before, or  
any change or alteration in him . . .), and his wits went  
from him in such sort that he died three days after.  
*North*, tr. of *Putarch's Lives*, p. 221 (quoted in *Trench*).

*centage* of loss; the *percentage* of oxygen in  
some compound, or of pure metal in an ore;  
specifically, in *com.*, an allowance, duty, com-  
mission, or rate of interest on a hundred;  
loosely, proportion in general.

At the church portals, to be sure, was the usual *per-*

**percept** (pér-sept), *n.* [*L. perceptum*, neut.  
of *perceptus*, perceived, pp. of *percepire*, *per-*  
*ceive*; see *perceive*.] The immediate object in  
perception, in the sense in which that word is  
used by modern psychologists.

Our analysis of perception has suggested the way in  
which our *percepts* are gradually built up and perfected.

*J. Sully*, *Outlines of Psychol.*, p. 209.

For a form expressing action or an active faculty;  
"perception," "conception," "imagination," "deduc-  
tion," "approbation." Some of these words express also  
the result of the action, thereby causing ambiguity on very  
important questions. Hence the introduction of the forms  
"*percept*," "*concept*," "*exhibit*," to express the things per-  
ceived, conceived, or exhibited, and to save circumlocu-  
tion. *A. Bain*, *English Grammar*, p. 143.

**perceptibility** (pér-sep-'ti-bil-'i-ti), *n.* [*per-* + *per-*  
*ceptibility* = Pr. *perceptibilitat* = Pg. *perceptibili-*  
*dade*; as *perceptible* + *-ity* (see *-ility*).] 1. The  
property of being perceptible: as, the *per-*  
*ceptibility* of light or color.

Nay, the very essence of truth here is this clear *percep-*  
*tibility* or intelligibility.

*Cudworth*, *Intellectual System*, p. 718.

2. Perception; power of perceiving. [Rare.]

The illumination is not so bright and fulgent as to ob-  
scure or extinguish all *perceptibility* of the reason.

*Dr. H. More*.

**perceptible** (pér-sep-'ti-bl), *a.* [*F. perceptible*

ing perceived; capable of coming under the  
cognizance of the senses; perceivable; notice-  
able.

state or property of being perceptible; percep-  
tibility.

**perceptibly** (pér-sep-'ti-bl), *adv.* In a percep-  
tible manner; in a degree or to an amount that  
may be perceived or noticed.

**perception** (pér-sep-'shon), *n.* [*F. perception*  
= Sp. *percepcion* = Pg. *percepção* = It. *perce-*  
*zione*, < L. *perceptio* (*n.*), a receiving or collecting,  
perception, comprehension, < *percepire*, pp. *per-*  
*ceptus*, obtain, perceive; see *perceive*.] 1. Origin-  
ally, and most commonly down to the middle  
of the eighteenth century, cognition; thought  
and sense in general, whether the faculty, the  
operation, or the resulting idea. Most psychol-  
ogists since Plato had made two departments of mental ac-  
tion, the orectic and the speculative; the latter was called  
*perception*, but it did not include belief founded on tes-  
timony. This use of the word is now uncommon in tech-  
nical language.

This experiment discovereth *perception* in plants, to move  
towards that which should comfort them, though at a dis-  
tance. *Bacon*.

[The Hobbesians] stontly contending that we have not  
the *perception* of anything but the phantasms of material  
objects, and of sensible words or marks, which we make to  
stand for such objects. *Dr. H. More*, *Immortality of Soul*.

The two great and principal actions of the mind, . . .  
*perception*, or thinking, and volition, or willing.

*Locke*, *Human Understanding*, II, vi. 2.

All the *perceptions* of the human mind resolve themselves  
into two distinct kinds, which I shall call impressions and  
ideas. *Hume*, *Treatise of Human Nature*, I. I. 1.

2. The mental faculty, operation, or resulting  
construction of the imagination, of gaining  
knowledge by virtue of a real action of an ob-  
ject upon the mind. It includes the first sensation,  
its objectification, its location, its intuitive assimilation  
of ideas already in the mind—in short, all the knowledge  
that is acquired involuntarily without our being aware  
of any process, and which seems to be directly given by  
sense. *Perception* may be internal or external.

*Perception* . . . being the first step and degree toward  
knowledge, and the inlet of all the materials of it.  
*Locke*, *Human Understanding*, II, ix. 15.

*Perception* is most properly applied to the evidence we  
have of external objects by our senses.

*Reid*, *Intellectual Powers*, I. i.

*Perception* is a complex mental act or process. More  
particularly, *perception* is that process by which the mind,  
after discriminating and identifying a sense-impression  
(simple or complex), supplements it by an accompaniment  
or escort of revived sensations, the whole aggregate of  
actual and revived sensations being solidified or "inte-  
grated" into the form of a percept—that is, an apparently  
immediate apprehension or cognition of an object now  
present in a particular locality or region of space.

*J. Sully*, *Outlines of Psychol.*, p. 152.

The manner in which the constituent elements in a *per-*  
*ception* are combined differs materially from what is strict-  
ly to be called the association of ideas. To realize this  
difference we need only to observe first how the sight of  
a suit of polished armour, for example, instantly reinstates  
and steadily maintains all that we retain of former sensa-  
tions of its hardness and smoothness and coldness, and  
then to observe how this same sight gradually calls up  
ideas now of tournaments, now of crusades, and so through  
all the changing imagery of romance.

*J. Ward*, *Encyc. Brit.*, XX, 57.

3. An immediate judgment founded on sense  
or other real action of the object upon the mind,  
more or less analogous to what takes place in  
vision. Thus, we are said to recognize our friends by  
*perception*. Also, mathematical, esthetic, and moral judg-  
ments founded on direct observation of imaginary or ideal  
objects are called *perceptions*.

It is admitted on all sides that the *perception* of an ob-  
ject necessarily implies the recognition of the object as  
this or that, as like certain objects, and as unlike certain  
other objects. Every act of *perception*, therefore, involves  
classification. *J. Fiske*, *Cosmic Philos.*, II, 107.

Her physical organization, being at once delicate and  
healthy, gave her a *perception*, operating with almost the  
effect of a spiritual medium, that somebody was near at  
hand. *Hawthorne*, *Seven Gables*, vi.

A great method is always within the *perception* of many  
before it is within the grasp of one. *De Morgan*.

Perhaps the quality specially needed for drawing the  
right conclusion from the facts, when one has got them,  
is best called *perception*, delicacy of *perception*.  
*M. Arnold*, *Literature and Dogma*, Preface.

**perch-loop** (pérch'lop), *n.* An iron fastened to a carriage-perch. It has loops for the straps which pass to the bed, to limit the swinging of the body.

**perchloric** (pér-klor'ik), *a.* [*< per- + chloric*.] Noting an acid (HClO<sub>4</sub>), a syrupy liquid obtained by decomposing potassium perchlorate by means of sulphuric acid. It is remarkable for the great readiness with which it gives up oxygen. Brought into contact with organic matter, it is instantly decomposed, often with explosive violence. Applied to the skin, it produces a very painful wound, which is extremely slow in healing. Also *hyperchloric*.

**perch-pest** (pérch'pest), *n.* A crustaceous parasite of the perch.

**Percidæ** (pér'si-dē), *n. pl.* [NL., *< Perca + -idæ*.] The perch family, a group of acanthopterygian fishes, to which widely varying limits have been assigned. (a) In Bonaparte's system, same as the first family of acanthopterygian fishes in Cuvier's system (*Percoides* in French). It included those with oblong bodies covered with scales which are generally hard or rough, with the operculum or preoperculum (or both) denticled or spinous at the edge, and the jaws and some part of the palate toothed. With such definition it included not only the modern *Percidæ* proper, but also many other families. (b) In Günther's system, the representative family of his *Acanthopterygii perciformes*, having perfect ventrals, unarm'd cheeks, uninterrupted lateral line, acute teeth in the jaws and on the palate, no barbels, the lower pectoral rays branched, and the vertical fins not scaly. (c) In recent American systems, *Percoides* with an increased number of abdominal and caudal vertebrae, depressed cranium and little prominent cranial ridges, dorsal fin generally separate, and anal with one or two spines. The species are inhabitants of fresh waters, and are represented by two genera common to North America and Europe (*Perca* and *Stizostedion*), several peculiar to the Palearctic region (*Acerina*, *Aspius*, *Percarina*), and the numerous darters, constituting the subfamily *Etheostominae*, peculiar to North America.

It includes the families *Percidæ*, *Squamipinnæ*, *Mullidæ*, *Sparidæ*, *Scombrinæ*, and several others.

**Percina** (pér'si-nā), *n. pl.* [NL., *< Perca + -ina*.] In Günther's system, the first group of *Percidæ*. They have the cleft of the mouth horizontal or slightly oblique, usually two dorsals, and seldom more than ten pyloric appendages. The *Percina* are mostly fresh-water fishes and scaly fishes which enter rivers, and belong to the family *Percidæ* and others of modern ichthyologists.

**Percinæ** (pér'si-nē), *n. pl.* [NL., *< Perca + -inæ*.] A subfamily of *Percidæ*, to which very different limits have been assigned. By old ichthyologists it was used for a large assemblage of genera scarcely definable by exact characters. By recent authors it has been much restricted, and, in its narrowest sense, includes the genera *Perca* and *Luciperca* or *Stizostedion*—that is, the true perches and the pike-perches. They have the pseudobranchiae well developed, the preoperculum serrate, seven branchiostegals, and a large air bladder.

H. Spencer, Prin. of Psychol., § 92.

**2.** Specifically, one to whom the unexpressed thoughts of another (called the *agent*) are sought to be transferred in conducting telepathic experiments. [Recent.]

We have therefore been able to convince ourselves that the agents, concentrating their looks on the given object, projected on the mental eye of the percipient a picture more or less resembling it, and we take it as incontrovertible that the above results could not have been achieved by conscious or unconscious guessing.

Proc. Amer. Soc. Psych. Research, I. 535.

**II. intrans.** To pass through small interstices, as a liquor; filter; as, water *percolates* through a porous stone.

2. A vessel made by sawing a large canoe in two in the middle, and inserting a plank to widen it. These were much used on the coast of the Carolinas in the eighteenth century, and even made voyages by open sea to Norfolk, carrying 10 to 20 barrels of pitch or tar. One 30 feet long and 5 to 6 inches wide is called "a small petiangua" in the Charleston, C. D. Gazette, 1744. Such a boat was also used on the Mississippi and its tributaries, where it is called *perique* and *perigue*. See *perique*.

These *Periomas* are long flat-bottom'd Boats, carrying from 20 to 25 tons. They have a kind of Forecastle and a cabin, but the rest open, and no deck. They have two masts which they can strike, and sails like Schooners. They row generally with two oars only.

**pericarp** (per-i-kärp), *n.* [= F. *péricarpe* = Sp. It. *pericarpio* = Pg. *pericarpo*, *<* NL. *pericarpium*, *<* Gr. *περικάρπιον*, a pod, husk, *<* *περι*, around, + *καρπός*, fruit.] In flowering plants, the seed-vessel or ripened ovary. It should accord in structure with the ovary from which it is derived, but extensive changes frequently take place during fructification by which the original ovarian form is obscured. Thus, by abortion the original number of cells in the ovary may be reduced in the fruit, as in the oak, chestnut, elm, and birch; or by the infusion of false partitions the original number may be increased in the fruit, as in *Datura*, *Lilium*, *Astragalus*, etc.

The pericarp may acquire external accretions, as the wing of the maple, ash, and hop-tree, the pickles on the pod of *Datura*, *Litens*, etc., or the barbs of the *Boraginaceæ*. Connected organs may modify the ovary, such as the adnate calyx of the apple, the pappus of the *Compositæ*, the persistent style of *Clematis*, the fleshy calyx of *Gaultheria*, or the fleshy receptacle of the strawberry. The walls of the ovary may change in consistence in the mature pericarp, being leaf-like in the pea-pod, columbine, calthia, etc., thickened and dry in nuts and capsules, fleshy or pulpy in berries, and fleshy without but indurated within, as in all stone-fruits. Where the walls of the pericarp are composed of dissimilar layers, the layers are distinguished as *exocarp*, *endocarp*, *epicarp*, *mesocarp*, and *putamen*. In cryptogams the pericarp is a variously modified structure containing certain organs of reproduction. Thus, in the *Characeæ* it incloses the oosperm, while in the *Floridææ* it incloses the carpospores. The term is also sometimes synonymous with the theca or capsule of mosses.

Lithologists are by no means agreed in regard to the nomenclature of the varieties of peridotite. M. E. Wadsworth distinguishes the following: *diatex*, composed almost entirely of olivin, with a few grains of picrotite, magnetite, or some other accessory mineral; *sarcinite*, a variety consisting of olivin and enstatite; *therzolite*, of olivin with enstatite and diaspase; *buchanrite*, of olivin, enstatite, and augite; *calysade*, of olivin and diaspase; *peridot*, of olivin and augite. Of these varieties, the first four have been found in meteorites as well as in terrestrial rocks; the others, so far as known, are exclusively terrestrial. Olivin passes readily into serpentine; hence many olivin rocks are found more or less completely altered into that mineral, so that the distinction between olivin and serpentine rocks is one not easily preserved. Peridotite is known to be in some cases an eruptive rock, and is generally supposed to have been such in all cases. That most serpentine rocks are the result of the alteration of some peridotite material is also generally conceded; that serpentine may have been produced in some other way is possible, but has not been distinctly proved.

7. In anc. pros., a group of two or more cola. According to the number of cola it contains, a period is dicolic, tricollic, tetracolic, etc. The end (apophysis) of a period must coincide with the end of a word, and is also characterized by admitting of syllaba anceps and hiatus. A single colon treated thus is also regarded as a period (a monocolic period). A monocolic, dicolic, etc., period is a meter. (See *meter*, 1 (b) (2).) Certain periods are known as *lines* or *verses*. (See *line*, 2, 6 (b).) A group of periods is called a *system*.

8. In music, a definite and complete division of a composition, usually consisting of two or more contrasted or complementary phrases; a complete musical sentence. 4. In rhet.: (a) Of or pertaining to a period or complete sentence; complete in grammatical structure. (b) Noting that form of sentence in which the sense is incomplete or suspended until the end is reached.

These principles afford a simple and sufficient answer to the vexed question as to the value of the periodic sentence—or sentence in which the meaning is suspended till the end—as compared with the loose sentence, or sentence which could have been brought to a grammatical close at one or more points before the end.

See *continued fraction*, under *continued*.—**Periodic curve, fever**, etc. See the nouns.—**Periodic function**. This phrase is used in different senses in the calculus of functions and in the theory of functions. In the former, a periodic function is one whose operation being iterated a certain number of times restores the variable. Thus,  $1 - x$  is such a function, since  $1 - (1 - x) = x$ . But in the theory of functions a periodic function is defined as a function having a period. For a more general definition, see *function*.—**Periodic inequality**, a disturbance in the motion of a planet dependent upon its position in its orbit relative to another planet, and hence going through its changes in periods not excessively long; opposed to *secular inequality*, which is a disturbance dependent upon the relative positions of two planetary orbits.—**Periodic law**, in chem., a relation of chemical elements expressed by the statement that the properties of the elements are periodic functions of their atomic weights. If the chemical elements are arranged in the order of their atomic weights, at regular intervals of the series will be found elements which have similar chemical and physical properties—that is, there is a periodic recurrence of these properties. If the elements showing this periodic recurrence are arranged in order by themselves, they form a group which, having similar properties and relations, follows a regular progression in the individual differences of its members.—**Periodic stars**. See *star*.—**Periodic winds**. See *monsoon* and *trade-wind*.

**periotic** (per-i-ō't'ik), *a.* and *n.* [*< Gr. peri, around, + ois (ōs-), the ear; see otic.*] **I. a.** Surrounding and containing the inner ear, or essential organ of hearing; composing or entering into the formation of the otic capsule, or otocranium, or otocranium; petromastoid; petrosal or petrous.

Several periotic bones are found in nearly all vertebrates. They may all remain distinct throughout life, but they are usually more or less confluent with one another, and may be, as in man, completely fused; furthermore, they may ankylose with other cranial bones, and thus give rise to certain parts of the compound temporal bone. The parts of a skull called *mastoid* are commonly outgrowths of periotic bones. The set of periotic bones composes a bony case for the inner ear, much as the case of a watch covers the works, and this is termed the *otocranium, otic capsule, or skull of the ear*. When mastoid parts are superadded, the resulting bone is called *petromastoid*. The human periotic bones form what are called the *petrous and mastoid* sections of the temporal bone. Periotic bones which have been distinguished and named in various animals are the *epiotic, prootic, epistiotic, and phrotic*. See these words, and *ent under hood*. **Periotic fenestra**, a cavity or depression included by the conspicuous superior semicircular canal, in the fetus or infant.

It is used in piloting submarine boats, and consists substantially of a vertical tube with a lenticular total-reflection prism at the top, by which horizontal rays are projected downward through the tube, and brought to a focus, after which they are received by a lens the principal focus of which coincides with that point. The vertical cylindrical beam thus formed is converted into a horizontal one again by a mirror inclined at 45° from the vertical axis of the tube, and is thus conveyed to an eyepiece, through which, by turning the tube on its vertical axis with its attached prism, a view of all the supernatant objects around the vessel may be obtained. **peritoneal, peritonæal** (per'i-tō-nē'al), *a.* [= F. *péritonéal* = Pg. *peritoneal*; as *peritonum*, *peritonæum*, + *-al*.] Of or pertaining to the peritoneum.—**Peritoneal cavity**, the cavity inclosed by the peritoneum.—**Peritoneal fever**. See *fever*.—**Peritoneal fossa**, pocket-like recesses of the peritoneum, such as Douglass's pouch, the rectovesical pouch, etc. Also called *peritoneal recesses*.—**Peritoneal ligaments**, certain reflections of the peritoneum from the walls of the abdomen or pelvis to the viscera, such as the ligaments of the liver, spleen, uterus, and bladder.—**Peritoneal sac**, in echinoderms, that part of the primitive vasoperitoneal vesicle of the embryo which gives rise to the peritoneum.

**peritoneum, peritonæum** (per'i-tō-nē'um), *n.* [= F. *péritoine* = Sp. *peritoneo* = Pg. It. *peritoneo*, < LL. *peritonæum*, *peritonum*, < Gr. *περίτονος*, prop. neut. of *περίτονος*, stretched over (περίτονος ὑμῶν or χιτῶν, the membrane inclosing the lower viscera), cf. *περίτονος*, stretched over, < *περιτείνω*, stretch over or around, < *περί*, around, + *τείνω*, stretch; see *tone*.] 1. The membrane lining the abdominal cavity and investing its viscera. It is a strong, uncolored, transparent, serous membrane, with a smooth, shining surface, attached to the subjacent structures by the subperitoneal areolar tissue, and forming a closed sac, except in the female, where it is continuous with the mucous membrane of the Fallopian tubes, or oviducts.

From the walls of the abdominal and pelvic cavities it is reflected at various places over the viscera, which it serves to invest and at the same time hold in position by its folds or duplicatures. These folds or duplicatures are of various kinds. Some of them, constituting the mesenteries (see *mesentery*), connect certain parts of the intestinal canal with the posterior abdominal walls; others form the so-called ligaments of the liver, spleen, stomach, and kidneys, the broad ligaments of the uterus, and the suspensory ligament of the bladder; still others form the omenta, folds attached to the greater and lesser curvatures of the stomach. That part which lines the abdominal and pelvic walls is called the *parietal* or *external* peritoneum; that which more or less completely invests the viscera, the *visceral* or *internal*. The cavity of the peritoneum is divided into two unequal parts by the constriction at Winslow's foramen; of these, the upper posterior one, lying back of and below the stomach and liver, is called the lesser cavity; the greater cavity lies in front and below. In vertebrates below mammals, in which there is no diaphragm, the peritoneum and the pleura (which is the corresponding thoracic serous membrane) are thrown into one, lining the whole pleuroperitoneal cavity and investing its contained viscera. The name *peritoneum* is extended to various similar or analogous, though not necessarily homologous, membranes or tunics which line the body-cavity of many different invertebrates.

2. In brachiopods, an investment of the alimentary canal, by which the latter is suspended in the perivisceral cavity as by a mesentery. Special folds form the gastroparietal and hepaparietal bands, respectively connecting the stomach and intestines with the parietes.

Relating to the city or government of Perm in eastern Russia.—**2.** Relating to the Permians.—**3.** An epithet applied by Murchison and his coadjutors in a geological reconnaissance of a part of Russia, in 1841, to a group of strata overlying the Carboniferous, and forming the uppermost division of the Paleozoic series. The rocks of which the Permian system is composed are largely red sandstone, and their equivalent in England had then been known as the *New Red Sandstone*, to distinguish it from the *Old Red Sandstone*, which lies beneath the Carboniferous. Eventually the New Red of England was found to be divisible (paleontologically) into two groups, of which the older was classed with the Paleozoic, and the newer placed in the Mesozoic. In Germany there is a well marked division of the Permian into two lithologically distinct groups; hence it is sometimes designated as the *Dynis*, a name coined in imitation of *Trias*. The divisions of the Permian in Germany are a lower series of sandstones, red and mottled in color (hence the name *Psittacite* has been applied to them, called the *Rothliegendes*, and an upper series of dolomites, marls, limestones, etc., called the *Zechstein*. The flora of the Permian in general closely resembles that of the Carboniferous, and several of the most characteristic plants of the latter pass upward into the Permian, but rise no higher. The cycads appear first in the Permian, and are largely increased in number and importance in the Trias. The Permian fauna is, on the whole, less rich than those of the overlying and underlying groups. The Permian is of great economical importance in Europe, as the repository of extensive deposits of rock-salt, gypsum, and other saline combinations.

3. In *math.*, a linear arrangement of objects resulting from a change of their order. *Permutation* differs from *combination* in this, that in the latter there is no reference to the order in which the quantities are combined, whereas in the former this order is considered, and consequently the number of permutations always exceeds the number of combinations. If *n* represents the number of quantities, then the number of permutations that can be formed out of them, taking two by two together, is *n* × (*n* - 1); taken three and three together, it is *n* × (*n* - 1) × (*n* - 2); and so on. Sometimes called *alteration*. See *combination*, 5.

4. In *philol.*, the mutation or interchange of consonants, especially of allied consonants.—**Cyclical permutation**, an arrangement obtained by advancing all the objects the same number of places, the first place being for this purpose considered as coming next after the last, so as to form a cycle. **Permutation-lock**. *South, Sermons.*

3. In *law*: (a) A limitation intended to be unalterable and of indefinite duration; a disposition of property which attempts to make it inalienable beyond certain limits fixed or conceived as being fixed by the general law. *Pollack*. The evils incident to rendering any specific piece of land or fund inalienable, and thus shutting it out from the general circulation of property, early led the courts to hold provisions for a perpetual suspension of the power of alienation to be void. The desire of owners of estates to perpetuate the wealth of the family led to attempts to create forfeitures and gifts over to other persons, by way of shielding the successor in the title from temptation to alienate; and as the right to create life-estates and trusts, and to add gifts over to other persons upon the termination of precedent estates, could not be wholly denied, the question has been what temporary suspension of the power of alienation is reasonable and allowable, and what is too remote and to be held void as "tending to create a perpetuity." (See *remote*.) The limit now generally established for this purpose in varying forms is substantially to the effect that no disposition of real property or creation of an estate therein is valid if it suspends the absolute power of alienation for more than a period measured by a life or lives in being plus 21 years and 9 months. Hence, since literal perpetuities are no longer known, except in the law of charities, etc., the phrase *rule against perpetuities* has come to mean in ordinary usage the rule against future estates which are void for remoteness as "tending to create a perpetuity." (b) Duration to all futurity; exemption from intermission or ceasing. —4. In the doctrine of annuities, the number of years in which the simple interest of any principal sum will amount to the same as the principal itself; or the number of years' purchase to be given for an annuity which is to continue forever; also, the annuity itself. —In **perpetuity**, for an endless or an indefinite length of time; forever.

Cf. assist, etc.*] To continue steadily and firmly in some state, course of action, or pursuit, especially in spite of opposition, remonstrance, etc.; persevere, especially with some degree of obstinacy.

Thus to *persist* in doing wrong estimates not wrong, but makes it much more heavy. *Shak., T. and C., ii. 2. 156.*

**persistence** (pér-sis'tens), *n.* [*Also persistencia; < F. persistance = Sp. Pg. persistencia = It. per-*

*sistenza*, < ML. *\*persistenti*, < L. *persisten(t)-s*, persistent; see *persist*.] 1. The quality of being persistent; steady or firm adherence to or continuance in a state, course of action, or pursuit that has been entered upon; especially (of persons), a more or less obstinate perseverance; perseverance notwithstanding opposition, warning, remonstrance, etc.—2. The continuance of an effect after the cause which first gave rise to it is removed: as, the *persistence* of the impression of light on the retina after the luminous object is withdrawn; the *persistence* of force.

**Persistence of force**, the law of mechanics. The phrase was introduced by Herbert Spencer to sum up all the laws of mechanics, especially the two principles of the permanence of matter and the conservation of energy. The law of action and reaction may be considered as consisting in the persistence of the algebraic sum of the momenta; and in fact every such law may be stated in an integrated form which contains an arbitrary constant independent of the time. **Persistence of vision**, the continuance of a visual impression upon the retina of the eye after the exciting cause is removed. The length of time varies with the intensity of the light and the excitability of the retina, and ordinarily is brief, though the duration may be for hours or even days. The after-image may be either positive or negative, the latter when the bright parts appear dark and the colored parts in their corresponding contrast-colors. It is because of this persistence that, for example, a firebrand moved very rapidly appears as a line or circle of light. The phenakistoscope, zoetrope, and other similar contrivances depend for their effect upon this principle. = **Syn** 1. *Industrious Application*, etc. (see *assiduity*), pertinacity, doggedness.

**persistence** (pér-sis'ten-si), *n.* [*As persistence* (see *ecy*).] Same as *perseverance*, 1.

Matter is indestructible, motion is continuous, and beneath both these universal truths lies the fundamental truth that force is *persistent*. *J. Fiske*, *Idea of God*, p. 150.

3. Specifically—(a) In *bot.*, continuing without withering: opposed to *caducous*, *deciduous*, or *marcescent*; as, a *persistent* calyx (one remaining after the corolla has withered). (b) In *zool.*, perennial; holding to morphological character, or continuing in functional activity; not degenerate, deciduous, or caducous, as a part or an organ; as, *persistent* types of structure; the *persistent* horns of cattle or gills of newts.

There are several groups which show special marks of degeneracy. Such are the reduced maxillary bones and *persistent* gills of the Proteids.

3. The art of representing solid objects on a flat surface so that when they are viewed the eye is affected in the same manner as it would be by viewing the objects themselves from a given point. By *perspective*, in common language, is meant *linear perspective*, or the art of delineating the outlines of objects, of their shadows, and of their reflections. The theory is that the positions of the delineated points in the picture are such that if rays, or straight lines, were drawn from the corresponding *original points* in the natural objects to the eye of the spectator, and if the picture were then interposed in the right position, it would be pierced by these rays at the *points of delineation*. It follows that perspective supposes that a picture is to be looked at with one eye placed in a particular position; and if it be otherwise looked at, the perspective necessarily appears false. This position of the eye, called the *station-*

*JKCK*, an original plane; *KCDI*, another original plane; *CK*, their intersection, an original line; *AECD*, plane of delineation; *E*, station-point; *EEGH*, directing plane; *EADH*, vanishing plane of original plane *JKCK*; *BC*, its intersecting line; *AD*, its vanishing line; *FG*, its directing line; *EFG*, vanishing plane of original plane *KCDI*; *FC*, its intersecting line; *IK*, its vanishing line; *AG*, its directing line; *C*, intersecting point of line *CK*; *A*, its vanishing point; *G*, its directing point; *FG*, its director; *AC*, its delineation.

*point*, or *point of sight* (which phrase with old writers has, however, another meaning), is according to the directions of most treatises, placed much too near the picture to represent the mean position of a person looking at it. Ar-

tists consequently find it necessary to modify the forms which strict perspective would prescribe. To ascertain how an *original line or plane* (that is, a line or plane in nature) is to be delineated, we have to consider, first, the *intersecting point or line*, also called the *intersection of the original line or plane* (that is, the point or line where the original line or plane, extended if necessary, cuts the *plane of delineation*, or the plane of the picture extended to infinity); and, second, the *vanishing point* of the original line, or the *vanishing line* of the original plane (that is, the point or line where the plane of delineation is cut by a line or plane passing through the eye parallel to the original line or plane). An original line is represented by some portion of the line from its intersecting point to its vanishing point; and every line in a given original plane has its intersecting point on the intersecting line and its vanishing point on the vanishing line of that plane. It is also proper to consider the *directing plane*, or plane through the eye parallel to the picture, the *directing line*, or line in which the directing plane cuts an original plane; the *directing point*, or point in which the directing plane is pierced by an original line; and the *director*, or line from the eye to a directing point. It is further necessary to take account of the *direct cubit*, or *principal visual ray*, being the perpendicular let fall from the eye upon the plane of delineation; the *center of the picture*, or *center of vision* (called by old writers the *point of sight*), being the foot of that perpendicular; and the *principal distance*, or *distance of the picture*, being the perpendicular distance of the plane of delineation from the eye. The *ground plane* is the level plane on which the spectator is supposed to stand. The *horizontal line*, or *horizon*, is the line in which the level plane through the eye cuts the picture, passing ordinarily through the center. This would better be termed the *horizontal line at infinity*, for, owing to the dip of the horizon (which see, under *dip*), it differs sensibly from the delineation of the true horizon. Linear perspective is merely a branch of descriptive geometry, itself an application of projective geometry. Perspective is intimately connected with the arts of design, and is particularly necessary in the art of painting, as without a correct observance of perspective no picture can have truth. Perspective is illustrated in the correct delineation of even the simplest positions of objects.

4. A drawing or representation in perspective; specifically, a painting so placed at the end of an alley, a garden, or the like, as to present the appearance of continuing it, and thus produce the impression of greater length or extent. Stage scenic painting is of this nature.

See *gauche*.—**In perspective**, according to the laws of perspective; hence, represented on a flat surface in such a way as to convey the idea of solidity and distance.

= **Syn.** *Opinion, Belief, Persuasion, Conviction, and Faith* agree in expressing the assent of the mind. *Opinion* has the least feeling or energy, is most intellectual. *Belief* may be purely intellectual, or largely moral by the consent of the feelings or the will. *Persuasion* is a word borrowed from the field of action; primarily, we *persuade* one to do something by motives addressed to his feelings or interests; when the word is applied to opinions, it seems to retain much of its original sense, suggesting that the *persuasion* is founded largely on the feelings or wishes: we have a *persuasion* of that which we are willing to believe. *Conviction* starts from the other side, primarily suggesting that one was rather reluctantly forced to believe by the weight of evidence; it is now more often used of settled, profound, and earnest beliefs; as, his deepest *convictions* of right and duty. *Faith* rests upon belief, but implies confidence in a person on whose authority one depends at least partly, and the gathering of feeling about the opinion held; it is a confident belief: as, to have implicit *faith* in a friend or a promise. See *Inference*, and quotation from *Wordsworth* under definition 2.

*Opinion* in good men is but knowledge in the making.  
*Milton, Areopagitica*, p. 46.

*Belief* is regarded . . . as the recognition by conscience of moral truth. *Locky, Rationalism*, I. 191.

Surely force cannot work *persuasion*, which is faith.  
*Milton, Civil Power*.

*Conviction* and *persuasion* are commonly used as synonymous terms; or, if any difference be made between them, it lies in this, that *conviction* denotes the beginning, and *persuasion* the continuance, of assent; for we are said to be convinced when brought by fresh evidence to the belief of a proposition we did not hold for truth before, but remain persuaded of what we have formerly seen sufficient grounds to gain our credit.

4. In *astron.*, a deviation of the motion of a planet or comet from a fixed orbit or from its regular velocity in that orbit. Perturbations are caused by the gravitating action of bodies other than the primary or central body. They are commonly and conveniently conceived, not as drawing the planets out of their orbits, but as consisting in gradual changes of the elements of the orbits themselves. All perturbations due to gravitation are, strictly speaking, periodical. But

some of them, which depend upon the relative situation of the orbits of different planets, go through their changes in such vast intervals of time that they are more conveniently regarded as progressive and not periodic, and are termed *secular perturbations*; while others, depending for the most part upon the relative situations of the planets in their orbits, go through their changes in comparatively short intervals of time, and can only be represented as periodic, and these are technically called the *periodic inequalities*. = *Syn.* 1. Agitation, trepidation, uneasiness, worry, discomposure.

**perturbatory** (pér-tér-bä-tō-rī), *a.* [*< perturbare* + *-ory*.] A name once used by real and pretended believers in the divining-rod to indicate a hypothetical power assumed to reside in certain individuals whereby they can exert a perturbing influence upon the motion of a swinging pendulum, etc. Its characteristics were an expansive quality, residing most abundantly in the thumb and forefinger, whereby the center of gravity of a pendulum held by these digits would be caused to describe a circle, and a compressive quality, belonging to the middle finger, which resists such motion. A man with a high compressive or "active" perturbatory, touching with his middle finger the hand of another with the expansive perturbatory well developed in thumb and forefinger, might neutralize the perturbatory in the latter, which is of the "passive" variety. A person equally endowed with these perturbatories would be negative, and so forth.

The passive *perturbatory* is a high degree of expansive, and the active *perturbatory* in like manner a powerful compressive.

ness, by actors in their make-up, and at one time by people generally in conformity to a fashion; a wig. About the middle of the sixteenth century wearing the peruke became a fashion. Immense perukes with curls falling upon the shoulders were worn from about 1660 to 1725, and were then succeeded by smaller and more convenient forms, which had also existed contemporaneously with the former. As late as 1825 some old-fashioned people still wore perukes, and a reminiscence of them remains in Great Britain in the wigs of the Lord Chancellor, the Speaker of the House of Commons, judges, barristers, etc.

*Milton*, P. L., ix. 405. = **Syn.** 2. *Perverse*, *Forward*, wilful, mischievous.

The derivations of *perverse* and *forward* suggest essentially the same idea. *Forward*, however, has reference only to one's attitude in regard to obedience, and chiefly, therefore, to the behavior of children; in *Shakespeare*, of women. It is not used of a disobedient spirit toward civil law, and *perverse* is only indirectly so used. *Perverse* has reference to one's attitude, in both conduct and opinion. The *perverse* person is settled in habit and disposition of contrariness; he not only likes or dislikes, acts or refuses to act, by the rule of contradiction to the wishes, commands, or opinions of others, especially of those whom he ought to consider, but he is likely even to take pains to do or say that which he knows to be offensive or painful to them. *Perversely* may be found in a child, but it is so settled an element of character as to be rather the mark of an adult. **petrography** (pet-rō-gra-fī), *n.* [= *F. petrographie*; *< Gr. πέτρα, a rock. πέτρος, a stone, + -γραφία, < γράφω, write.*] 1. The art of writing or inscribing on stone.—2. The study of rocks; lithology; petrology. The investigation of the minerals of which rocks are made up is called *lithology*, which includes not only the determination of the mineral constituents of a rock, but also the study of the changes which these constituent minerals have undergone, either during the consolidation of the rock or at a subsequent period, in the course of those changes which are denominated *metamorphic* (see *metamorphism*)—changes often complicated and difficult to decipher. While in some rocks the constituents are crystallized in large and distinctly formed individuals, so that each species can be separated and analyzed by itself without difficulty, this is ordinarily not the case. Hence by the methods formerly pursued it was often extremely difficult, if not impossible, to make out clearly of what species the rock was composed. At the present time the method of examination of a rock consists in cutting from it one or more sections sufficiently thin to be nearly transparent; these are examined with the microscope, with and without the use of polarized light; and the optical and crystallographic appearances presented are generally sufficient to give not only a correct idea of the nature of the minerals, but also of the changes which they have undergone through various stages of metamorphism. Assistance is also afforded by the method of separation in which gravity solutions are employed. (See *gravity solution*.) While most geologists writing in English use the terms *lithology*, *petrology*, and *petrography* as nearly synonymous, others desire to limit the meaning of the first of these to the indoor or laboratory study of rocks, and would define *petrography* as including their investigation both indoors and in the field.

*Petrography* I define as that branch of science which embraces both lithology and petrology. It includes everything that pertains to the origin, formation, occurrence, alteration, history, relations, structure, and classification of rocks as such. It is the essential union of field and laboratory study. *M. E. Wadsworth, Lithological Studies, p. 2.*

**petrolatum** (pet-rō-lā'tum), *n.* [NL. *< petrolemum, q. v.*] A soft unctuous substance, consisting mainly of hydrocarbons of the paraffin series, obtained from residues left after the distillation of lighter oils from crude petroleum, or deposited from crude petroleum on standing. When purified and deodorized, it forms a salvy neutral mass, yellow or reddish in color, odorless, tasteless, and somewhat fluorescent. It is used as a basis for ointments and as a protective dressing. Also called *vaseline* and *cosmoline*.

**petrolene** (pet-rō-lēn), *n.* [= *F. pétroleum*; as *petrol, petrol(eum)*, + *-um*]. A liquid hydrocarbon mixture obtained from petroleum.

Svs. petroleum* (MD. *petrolie*), *< ML. petroleum* (also *petrichum, petrichum*, *< MGr. NGr. πετρέλαιον*), rock-oil, *< L. petra* (*< Gr. πέτρα*), rock, + *oleum* (*< Gr. ἔλαιον*), oil; see *oil*.] A ML. adj. *petroleus*, pertaining to rocks (neut. *petroleum*, or *oleum petroleum*, rock-oil), is given.] An oily substance of great economical importance, especially as a source of light, occurring naturally oozing from crevices in rocks, or floating on the surface of water, and also obtained in very large quantity in various parts of the world by boring into the rock; rock-oil. Petroleum was known to the Persians, Greeks, and Romans under the name of *naphtha*; the less liquid varieties were called *ασφαλτης* by the Greeks, and *bitumen* was with the Romans a generic name for all the naturally occurring hydrocarbons which are now included under the names of *asphaltum, maltha*, and *petroleum*. The last name was not in use in classic times. The existence of petroleum in Pennsylvania and New York has been known from almost the earliest time of the settlement of those States by Europeans, but it was not until 1859, when oil was obtained by boring at Titusville on Oil Creek, a branch of the Allegheny River, that it began to be of commercial importance. At the present time the production of crude

petroleum reaches an amount nearly equal to thirty millions of barrels a year, and the value of the exports of this article in various forms amounts to almost \$30,000,000 a year, nearly all the material exported being furnished by the oil fields of Pennsylvania and western New York. The crude oil undergoes refining, and is put upon the market in various forms (see *kerosene, naphtha, kerosene*, etc.), but much the largest part of this product has the form of an oil suitable for burning in lamps in all parts of the world. The only other oil-producing region in the world at all comparing with that of Pennsylvania and New York is at and near Baku, on the Caspian, where the existence of oil has been known from time immemorial, but where its commercial importance has only recently been realized. The exported petroleum of the United States are chiefly from rocks of Devonian age; those of Baku occur in the Tertiary. An important part of the transportation of the crude material in the United States is effected by pipes laid beneath the surface, through which the oil is forced. See *pipe-line*. Also called *coal-oil, earth-oil*.

See *capitious*.

*John Taylor*, *Works* (1639). (*Nares*)

But the Indians called it (tobacco) *Petun* or *petum*, which indeed is also the fittest name that both we and other Nations may call it by, deriving it of Peto, for it is far fetched and much desired.

It. falange. < L. phalanx (phalang-), < Gr. φαλαγξ (phalagx-), a line or order of battle, a rank of soldiers, a phalanx* (def. 1), also a round piece of wood, the bone between joints of the fingers and toes, etc.]

1. In *Gr. antiq.*, in general, the whole of the heavy-armed infantry of an army; particularly, a single grand division of that class of troops when formed in ranks and files close and deep, with their shields joined and long spears overlapping one another so as to present a firm and serried front to a foe. The celebrated Macedonian phalanx was normally drawn up sixteen ranks deep, the men being clad in armor, bearing shields, and armed with swords and with spears from 21 to 24 feet long. In array the shields formed a continuous bulwark, and the ranks were placed at such intervals that five spears which were borne pointed forward and upward protected every man in the front rank. The phalanx on smooth ground, and with its flanks and rear adequately protected, was practically invincible; but it was cumbersome and slow in movement, and if once broken could only with great difficulty be reformed.

Among them move  
In perfect phalanx to the Dorian mood  
Of flutes and soft recorders. *Milton, P. L.*, l. 551.

2. Any body of troops or men formed in close array, or any combination of people distinguished for firmness and solidity of union.—3.

In Fourier's plan for the reorganization of society, a group of persons, numbering about 1,800, living together and holding their property in common. See *Fourierism*.—4. In *anat.* and *zool.*: (a) A row or series of bones in the fingers or toes. Hence—(b) One of the bones of the fingers or toes; a digital internode, succeeding the metacarpal or metatarsal bones, collectively constituting the skeleton of the third and distal segment of the hand or foot; so called from their regular disposition in several rows. The normal number of the phalanges of each digit is three. This is only exceptionally increased, as in the flippers of some cetaceans and extinct reptiles; but it is frequently reduced, as in most of the digits of birds, and in the inner digits of mammals which have five fingers and toes. In man the phalanges of the fingers and toes are each fourteen, three to every digit excepting the thumb and great toe, which have two apiece. The original implication of the term seems to have been any one of the cross-rows of small bones between the successive knuckles of the fingers or toes, or the longitudinal series of small bones of any one finger or toe. But usage transfers the sense of *phalanx* to any one of these bones, two or more of which are *phalanges*. See cuts under *Artiodactyla*, *carpus*, *Catarrhini*, *foot*, *hand*, *Ichthyosauria*, *Perissodactyla*, *pinnion*, *Plesiosaurs*, *solidungulate*, *tarsus*, and *Ornithoscelida*. (c) One of the fiddle-shaped cells of the lamina reticularis of the Cortian organ. Also called *Deiters's phalanges*.—5. In *zool.*, a group or series of animals, of indeterminate classificatory value; one of several groups which may be interposed above genera and below classes or orders. A phalanx frequently corresponds in value to a subfamily, but has no recognized fixed place in classification. Sometimes synonymous with *cohort* or *agmen*.—Basilar phalanx, a phalanx of the proximal row.—Middle phalanx, a phalanx of the middle row.—Ungual phalanx, the terminal phalanx, on which is the nail.

There are 3 species, usually placed in as many genera, of elegant and varied coloration, and in general resembling sandpipers; but the body is depressed rather than compressed, and the plumage of the under parts is thick and compact to resist water, upon which these little birds swim with great ease and grace. They are found on inland waters and along the coasts of most parts of the world, sometimes venturing far out to sea. Two of the three species breed only in boreal regions, and perform extensive migrations in the spring and fall. Wilson's phalarope, *Phalaropus (Steganopus) wilsoni*, the largest and handsomest species, is confined to America, breeding from northerly parts of the United States northward, and dispersing in winter over South America. It is 8½ inches long, and 15½ in extent of wings; the bill is 1½ inches long and extremely slender; the margins of the toes are not scalloped. The female exceeds the male in size and beauty, and the male performs the task of incubation. The red-necked or northern phalarope is *Phalaropus (Lobipes) hyperboreus*; this has a slender bill like the first, but is smaller, and the membrane
